1. INTRODUCTION

1.1 Versions and revisions

Episode design is an iterative process that typically involves multiple stakeholders. Once the design is finalized and the episode implemented, experience with the new payment model may generate new insights. The insights can in turn be leveraged to modify and improve the initial episode design. To keep track of the version of an episode used at any given time, a versioning system consisting of three numbers is employed:

- The algorithm version reflects the version of the software code used to produce the outputs for a particular episode. It is indicated by a major and minor version number, e.g., a1.1. The major algorithm version does not reset. The minor algorithm version resets when the major algorithm version is incremented.
- The configuration version reflects the version of the parameter settings and medical codes used to produce the outputs for a particular episode. The configuration includes for example the dollar amounts for the gain/risk sharing thresholds and the trigger diagnosis codes. The configuration version is indicated by a two digit number, e.g., c01. It is specific to the design decisions made by the organization that is implementing an episode and it does not reset.
- The documentation version reflects the version of the Detailed Business Requirements describing a particular episode. It is indicated by a two digit number, e.g., d01, and increments when a revision is made to the documentation without making a change to the algorithm or the configuration. It resets every time the algorithm or the configuration version changes.

Version	Date	Changes
a1.0 c01 d01	09/19/2016	■ Initial base definition design
a1.0 c02 d01	12/20/2016	■ Configuration and DBR: Added an exclusion for episodes where the PAP is a federally qualified health center or rural health clinic. The changes in algorithm logic are reflected in sections 2.3.6, 3.4.1, and 4.6. The codes used to identify FQHC/RHCs are listed in the configuration file under 'Business Exclusions – FQHC and RHC'

Version	Date	Changes
		<ul style="list-style-type: none"> ■ Configuration and DBR: Renamed the list ‘Business Exclusions – TPL FQHC And RHC’ to ‘Business Exclusions – TPL Exempt Places of Service’ ■ DBR: Updated definition of the multiple payers exclusion to only exclude episodes where a patient changes enrollment between MCPs, not between FFS and an MCP. The method of identifying. The changes in algorithm logic are reflected in sections 2.3.6 and 4.6
a.1.0 c03 d01	03/14/2018	<ul style="list-style-type: none"> ■ Configuration and DBR: Added two additional informational quality metrics – Spironolactone and Eplerenone fill rate and rate of cardiac rehabilitation, and updated risk factors ■ Configuration: Refined the DKA/HHS exclusion list
a.1.0 c04 d01	6/12/2018	<ul style="list-style-type: none"> ■ Configuration: Updated the following code lists: ‘Comorbidities Cancer - Diagnoses’; ‘Comorbidities Cancer Active - Diagnoses’; ‘Comorbidities Cancer Active - Procedures’; ‘Comorbidities Coma And Brain Damage - Diagnoses’; ‘Comorbidities Multiple Sclerosis - Diagnosis’ ■ DBR: Updated language around setting potential trigger start and end dates in section 4.1 ■ DBR: Updated trigger window spend inclusion language to specify that claim detail lines that are assigned to the trigger window are included in section 4.3 ■ DBR: Updated language for non-acute trigger and concurrent episode exclusions in section 4.6

1.2 Scope of this document

The Detailed Business Requirements (DBR) document serves as a guide to understand the definition of an episode. The DBR addresses three audiences:

- The episode owner who is accountable overall for the episode design and implementation
- The analytics team tasked with pressure testing the design of an episode and quality controlling the outputs from the episode algorithm
- The IT team tasked with implementing the algorithm to produce outputs for an episode

Section 2 of the DBR contains a description of the episode and is aimed at the episode owner and the analytics team. It addresses the following questions:

- **Patient journey:** Which patient cases are addressed by the episode?
- **Sources of value:** At which points in the patient journey do providers have most potential to improve quality of care and outcomes?
- **Design dimensions:** What decisions underlie the design of the episode?
 - Trigger: What events trigger an episode?
 - Episode duration: What is the duration of the episode?
 - Claims included and excluded: Which claims are included in or excluded from the episode spend?
 - Episode spend: How is the spend for an episode calculated?
 - Principal Accountable Provider (PAP): Which provider is primarily held accountable for the outcomes of an episode?
 - Excluded episodes: Which episodes are excluded from a PAP’s average episode spend for the purposes of calculating any gain/risk sharing?
 - Quality metrics: Which quality metrics are employed to inform PAPs about their quality of care?
 - Risk adjustment: What approach is taken to adjust episodes for risk factors that cannot be directly influenced by the PAP?
 - Gain and risk sharing: How are the gain and risk sharing amounts for PAPs determined?

Section 3 of the DBR explains the data flow of an episode. It is aimed at the analytics team and the IT team and addresses the following questions:

- **Input data:** What inputs does the episode algorithm require to build the episode?
- **Episode algorithm:** What is the intent of the episode design that needs to be reflected in the software code to produce the episode outputs?
- **Episode configuration:** What parameters (e.g., dollar amounts) and medical codes (e.g., diagnosis codes) need to be specified to define the episode?
- **Outputs:** What are the outputs of an episode algorithm?
- **Provider reports:** What information is included in the provider reports?

The algorithm logic in section 4 of the DBR is aimed at the IT team. It may also be helpful to the analytics team in their communication with the IT team over the course of quality controlling an episode. The algorithm logic addresses the following questions:

- What are the logical steps the episode algorithm needs to complete in order to produce the required outputs?
- Which cases does the algorithm need to address?
- Are there exceptions to the overall logic and, if so, how are they handled?

The DBR document does not cover the following topics:

- Background on how episodes compare to the current payment system
- Clinical rationale for inclusions and exclusions
- Intermediate analyses used during design of the episode
- Meeting materials used during design of the episode
- Guidance on data collection/transformation/storage
- Guidance on the episode algorithm coding approach

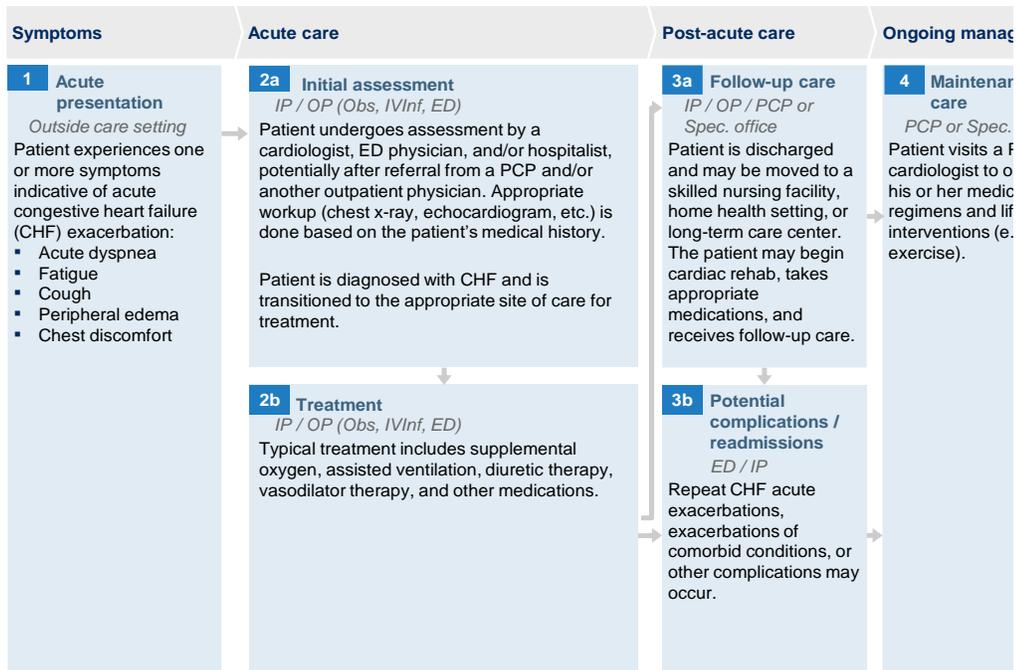

2. DESCRIPTION OF THE EPISODE

2.1 Patient journey

The episode described in this document pertains to patients who have an acute congestive heart failure (CHF) exacerbation for which they are treated in an inpatient, outpatient, or office. A separate configuration file is provided for the acute CHF exacerbation episode and providers will receive reports for this episode.

As depicted in Exhibit 1, an acute CHF exacerbation episode typically starts with an office or emergency department visit during which symptoms, such as dyspnea, fatigue, peripheral edema, and chest discomfort are treated. As depicted in Exhibit 1, an acute CHF exacerbation episode may require examination, testing, and imaging (e.g., chest x-ray or echocardiogram) in order to diagnose the condition. During the visit, the patient may be prescribed medications (e.g., loop diuretics) and other treatments. The patient may also undergo follow-up care if symptoms persist. Some patients may develop complications requiring further treatment in an inpatient or outpatient facility.

EXHIBIT 1 – PATIENT JOURNEY FOR THE ACUTE CHF EXACERBATION EPISODE

2.2 Sources of value

In treating patients with acute CHF exacerbation, providers have several opportunities to improve the quality and cost of care (see Exhibits 3 and 4) and reduce clinical variation. For example, providers can minimize duplicative testing in the outpatient and inpatient settings and can adequately decide whether or not to admit a patient in the hospital. Further, providers can optimize medication regimens (e.g., give diuretics and vasodilators during inpatient and ACE inhibitor and Beta-blockers during outpatient). Finally, providers can improve long-term outcomes by giving smoking cessation consultations to patients and by encouraging follow-up visits to the cardiologist and/or primary care physician. In general, these practices could reduce the likelihood of avoidable admissions and reduce the overall cost of care for acute CHF exacerbation.

EXHIBIT 2 – SOURCES OF VALUE FOR THE ACUTE CHF EXACERBATION EPISODE

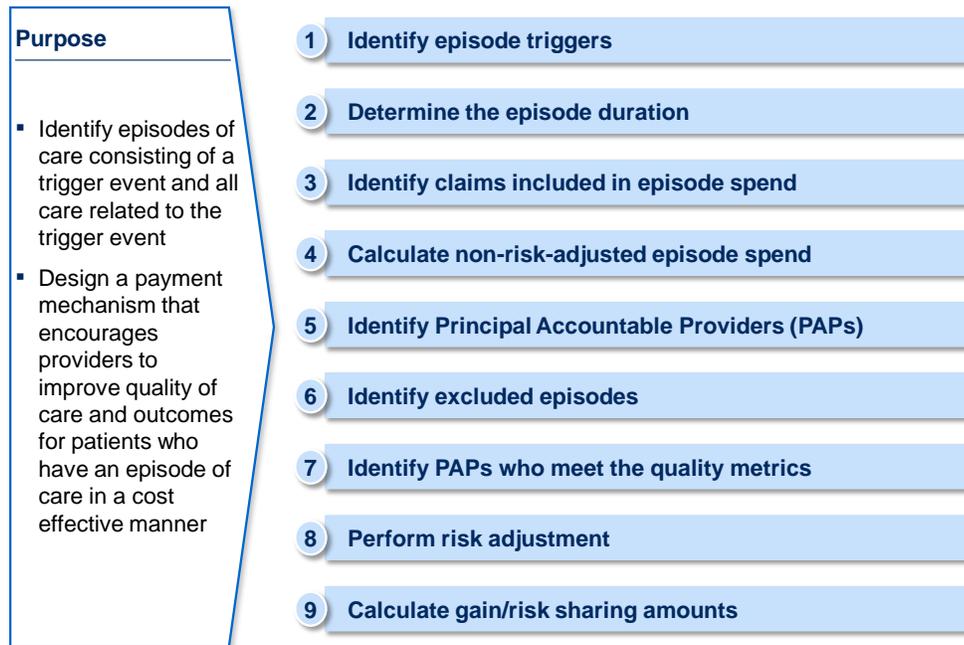

2.3 Design dimensions

Designing and building an acute CHF exacerbation episode comprises nine dimensions, as depicted in Exhibit 5. Each dimension is associated with a

set of data manipulations that convert the data inputs to the desired data outputs. Section 3 provides additional details on the episode data flow.

EXHIBIT 3 – EPISODE DESIGN DIMENSIONS

2.3.1 Episode trigger

A potential trigger for an acute CHF exacerbation episode is an observation, emergency department, outpatient IV infusion clinic, or inpatient visit for treatment of an exacerbation. Potential triggers are identified in three ways:

- **Acute CHF exacerbation-specific trigger diagnosis codes:** An observation, emergency department, outpatient IV infusion clinic, or inpatient claim is a potential trigger if it contains an acute CHF diagnosis code in the primary diagnosis field.
- **Acute CHF exacerbation-contingent trigger codes:** An observation, emergency department, outpatient IV infusion clinic, or inpatient claim is a potential trigger if either of the following conditions are met:
 - The claim contains a chronic heart failure trigger diagnosis code in the primary diagnosis field *and* the claim also contains at least one of the

acute CHF or signs and symptoms of CHF trigger diagnosis codes in any other diagnosis field.

- The claim contains a signs and symptoms of CHF trigger diagnosis code in the primary diagnosis field *and* the claim also contains at least one of the acute CHF or chronic heart failure trigger diagnosis codes in any other diagnosis field.

The acute or unspecified CHF diagnosis codes, chronic heart failure diagnosis codes, CHF signs and symptoms diagnosis codes, and revenue codes for the trigger locations emergency department, observation room, and IV infusion clinic are listed in the configuration file under “Trigger Diagnosis Codes – Acute CHF,” “Trigger Diagnosis Codes – Chronic CHF,” “Trigger Diagnosis Codes – Signs and Symptoms of CHF,” and “Trigger Revenue Codes.” Claim types referenced throughout the DBR are defined in the glossary.

A potential trigger lasts for the entire duration of the inpatient or outpatient facility claim that triggered the episode and extends through the discharge date of any overlapping admission.

2.3.2 Episode duration

The duration of the acute CHF exacerbation episode comprises the trigger window and the post-trigger window. Overall, the duration of the episode is referred to as the episode window.

- **Pre-trigger window:** The acute CHF exacerbation episode does not have a pre-trigger window.
- **Trigger window:** The trigger window begins on the first day of a potential trigger that constitutes an episode and ends on the last day of a potential trigger that constitutes an episode.
- **Post-trigger window:** The post-trigger window begins the day after the trigger window ends and extends for 30 days for the acute CHF exacerbation episode. If a hospitalization begins on or before the 30th day of the post-trigger window and extends beyond the 30th day (i.e., is ongoing on the 30th day of the post-trigger window) for acute CHF exacerbation episodes, then the post-trigger window is extended until discharge from the hospitalization. Extending the episode in this way may only occur once per episode and does not lead to further extensions.

Based on the definitions of the trigger and post-trigger window, potential triggers are divided into trigger acute CHF exacerbation and repeat acute CHF exacerbation:

- **Trigger acute CHF exacerbation:** Potential triggers that do not occur during another episode constitute the trigger window of a new episode.
- **Repeat acute CHF exacerbation:** Potential triggers that occur during the post-trigger window of an episode do not constitute the trigger window for a new episode.

2.3.3 Claims included in episode spend

Episode spend is calculated on the basis of claims directly related to or stemming from the patient's acute CHF exacerbation. Claims that are included in the calculation of episode spend are referred to as included claims. Claims that are not included in the calculation of episode spend are referred to as excluded claims. The criteria to identify included claims depend on the time window during which a claim occurs.

- **Pre-trigger window:** The acute CHF exacerbation episodes do not have a pre-trigger window.
- **Trigger window:** All inpatient, outpatient, professional, and pharmacy claims during the trigger window are included claims.
- **Post-trigger window:** Inpatient, outpatient, professional, and pharmacy claims during the post-trigger window that are related to the acute CHF exacerbation, or indicate potential complications are included claims. Included claims during the post-trigger window fall into the following groups:
 - **Included hospitalizations:** Hospitalizations that are related to the episode are identified using an included diagnosis code in the primary or other diagnoses fields of an inpatient claim. All inpatient claims that are part of an included hospitalization are included claims. Hospitalizations without an included diagnosis code in the primary diagnosis field of any inpatient claim in the hospitalization are considered unrelated hospitalizations and are not included in the calculation of episode spend.
 - **Included diagnosis-based outpatient and professional claims:** Outpatient and professional claims with an included diagnosis code in the primary

diagnosis field are included claims. All detail lines in the included outpatient or professional claim are included detail lines.

- Included E&M care: Outpatient and professional claim detail lines with included evaluation and management procedure codes and a relevant diagnosis code in the primary diagnosis field are included detail lines.
- Included medical procedures: Outpatient and professional claim detail lines with included imaging, testing, and other relevant procedures are included detail lines.
- Included medications: Pharmacy claims with an included medication code are included claims.

The one exception to the above logic are claims related to transportation and vaccines, which are always excluded claims when the procedures occur on outpatient and professional claims.

The codes used to identify included procedures, included E&M, relevant diagnoses, included medications, included complications, excluded transportation, and excluded vaccinations are listed in the configuration file under “Included Procedures,” “Included E&M,” “Relevant Diagnoses,” “Included Medications,” “Included Complication Diagnoses,” “Excluded Vaccination Procedures,” and “Excluded Transportation Procedures,” respectively.

2.3.4 Episode spend

The episode spend is the amount that reflects the totality of spend for included claims. Since the totality of spend for included claims is not risk-adjusted, it is referred to as non-risk-adjusted episode spend. Based on the available data, Ohio Medicaid calculates the non-risk-adjusted episode spend as the sum of the allowed amount for included claims from Medicaid Fee For Service (FFS) and the sum of the paid amount for included claims from Medicaid Managed Care Plans (MCPs). Given variation in data and payment practices, payers should use their judgment in determining which fields to utilize so as to best reflect the entire spend of an episode.

To remove variation in inpatient spend that is intentionally not addressed by the episode-based payment model, spend for included, DRG-paid inpatient claims is calculated by summing the APR-DRG base payment and the APR-DRG

outlier payment for each included, DRG-paid inpatient claim. Medical education and capital expenditure payments are not included in non-risk-adjusted episode spend.

The non-risk-adjusted episode spend is calculated overall and by claim type, by window during the episode, and by claim type and window during the episode.

For the purpose of risk-adjustment only, a separate measure of episode spend, referred to as normalized-non-risk-adjusted episode spend, is used. Normalized-non-risk-adjusted episode spend is calculated using normalized APR-DRG base rates for DRG-paid inpatient claims to remove variation in unit prices before performing risk adjustment. DRG-exempt inpatient, outpatient, professional, and pharmacy spend is calculated the same way for normalized-non-risk-adjusted episode spend as for non-risk-adjusted episode spend.

To calculate the DRG-paid inpatient spend component of normalized-non-risk-adjusted episode spend the APR-DRG base payment for each included DRG-paid inpatient claim is normalized using the following method: The normalized base rate is calculated as the average hospital base rate across all DRG-paid inpatient claims weighted by the volume of DRG-paid inpatient claims. The DRG base payment on each DRG-paid inpatient claim is then multiplied by the ratio of the normalized base rate to the actual base rate of each hospital. Outlier payments, if present, are added unchanged. The medical education payment and the capital expenditure payment are not included in normalized-non-risk-adjusted episode spend.

2.3.5 Principal Accountable Provider

The Principal Accountable Provider (PAP) is the provider deemed to be in the best position to influence the quality and cost of care for a patient with an acute CHF exacerbation. The PAP is the facility diagnosing the acute CHF exacerbation. The PAP is identified using the billing provider ID on the facility claim which triggered the episode.

2.3.6 Excluded episodes

Episode exclusions ensure that the remaining episodes are comparable to each other and allow fair comparisons between patient panels. After all exclusions that identify invalid episodes have been applied, a set of valid

episodes remains. The valid episodes form the basis to assess the performance of PAPs.

■ **Business exclusions:**

- Concurrent scope:
 - For acute CHF exacerbation episodes, an episode is excluded if PCI, CABG, or VALVE procedures occur during the trigger window. The configuration file lists these procedure codes under “Business Exclusions - PCI,” “Business Exclusions - CABG,” and “Business Exclusions - VALVE.”
- Duals: An episode is excluded if a patient has dual coverage by Medicaid and Medicare at any time during the episode window. The configuration file lists the codes used to identify dual eligible beneficiaries under “Business Exclusions - Duals.”
- Exempt PAP: An episode is excluded if the provider type of the PAP is not a hospital or if the PAP is a DRG-exempt inpatient facility.
- FQHC/RHC: An episode is excluded if the PAP is classified as a federally qualified health center or rural health clinic. The configuration file lists the codes used to identify FQHCs and RHCs under “Business Exclusions – FQHC and RHC.”
- Incomplete episodes: An episode is excluded if the non-risk-adjusted episode spend (not the risk-adjusted episode spend) is less than the incomplete episode threshold. Spend less than the incomplete episode threshold may be an indication that claims are miscoded or incomplete. The incomplete episode threshold was set at the cost of the minimum services required to treat an episode. The incomplete episode threshold is listed as a parameter in the configuration file under “Excluded Episodes.”
- Inconsistent enrollment: An episode is excluded if there are gaps in full Medicaid coverage (FFS or with an MCP) of the patient during the episode window. The configuration file lists the codes used to identify beneficiaries with inconsistent enrollment under “Business Exclusions – Inconsistent Enrollment.”
- Long hospitalization: An episode is excluded if a hospitalization longer than (>) 30 days occurs during the episode window.
- Long-term care: An episode is excluded if long-term care occurs during the episode window.

- Missing APR-DRG: An episode is excluded if a DRG-paid inpatient claim during the episode window is missing the APR-DRG and severity of illness.
- Multiple payers: An episode is excluded if a patient changes enrollment between MCPs during the trigger window or the post-trigger window(s) (if applicable). The rules to attribute an episode to a payer are described in the glossary under “Payer Attribution.”
- No PAP: An episode is excluded if the billing provider number is not available.
- Non-acute episodes: An episode is excluded when the episode does not contain an acute CHF exacerbation diagnosis.
- PAP out of state: An episode is excluded if the PAP’s practice address is outside Ohio.
- Third-party liability: An episode is excluded if third-party liability charges are present on any claim or claim detail line during the episode window or if the patient has relevant third-party coverage at any time during the episode window.

■ **Clinical exclusions:**

- Age: An acute CHF exacerbation episode is excluded if the patient is younger than eighteen (<18) or older than sixty-four (>64) years of age.
- Comorbidity: An episode is excluded if the patient has one or more of the following comorbidities during a specified time window. The configuration file lists the comorbidity codes and time windows under “Comorbidities <Comorbidity Name> - <Procedures or Diagnoses>.” Comorbidity codes are searched for on inpatient, outpatient, and professional claims.

The comorbidity exclusions are:

- Cancer under active management during the episode window or during the 90 days before the episode window
- Coma or brain damage during the episode window or during the 365 days before the episode window
- Cystic fibrosis during the episode window or during the 365 days before the episode window

- Diabetic ketoacidosis (DKA) or hyperosmolar hyperglycemic nonketotic syndrome (HHNS) during the trigger window and 90 days before the trigger window
 - End stage renal disease (ESRD) during the episode window or during the 365 days before the episode window
 - Human immunodeficiency virus (HIV) during the episode window or during the 365 days before the episode window
 - Multiple Sclerosis during the episode window or during the 365 days before the episode window
 - Organ transplant during the episode window or during the 365 days before the episode window
 - Paralysis during the episode window or during the 365 days before the episode window
 - Pneumonia during the first day of the trigger window
 - Pregnancy and/or delivery during the episode window or during the 90 days before the episode window
 - Resuscitation during the trigger window
 - Rheumatic heart disease during the episode window or during the 365 days before the episode window
 - Ventricular assistance device (VAD) procedure during the trigger window
- Death: An episode is excluded if the patient has a discharge status of “expired” on any inpatient or outpatient claim during the episode window or has a date of death before the end of the episode window.
 - Left Against Medical Advice: An episode is excluded if a patient has a discharge status of “left against medical advice or discontinued care” on any inpatient or outpatient claim during the episode window.
 - Multiple other comorbidities: An episode is excluded if it is affected by too many risk factors to reliably risk adjust the episode spend. The configuration file lists the number of risk factors beyond which an episode is excluded as a parameter under “Excluded Episodes.”

■ **Outliers:**

- High outlier: An episode is excluded if the risk-adjusted episode spend (not the non-risk-adjusted episode spend) is greater than the high outlier threshold. The high outlier threshold was set based on analyses of episode spend distributions for episodes that ended between October 2014 and September 2015, inclusive. It was set at three standard deviations above the average risk-adjusted episode spend for otherwise valid episodes. The high outlier threshold is listed as a parameter in the configuration file under “High Outlier.”

2.3.7 Quality metrics

A PAP must pass all quality metrics tied to gain sharing to be eligible for gain sharing. PAPs also receive information on additional quality metrics that allow them to assess their performance, but do not affect their eligibility to participate in gain sharing. Quality metrics are calculated for each individual PAP across valid episodes attributed to the PAP. The quality metrics are based on information contained in the claims filed for each patient. Additional information on how the quality metrics could be tied to gain sharing is provided in section 2.3.9 (“Gain and risk sharing”).

■ **Quality metric tied to gain sharing for acute CHF exacerbation episodes:**

- Quality metric 1: Percent of valid episodes with relevant follow-up care within 30 days of discharge. The codes used to identify follow-up care procedures are listed in the configuration file under “Quality Metric 01 Follow-Up Care.”
- Quality metric 2: Percent of valid episodes with filled Beta blocker during the episode window and 30 days before the episode. The codes used to identify Beta blockers are listed in the configuration file under “Quality Metric 02 Beta blocker.”
- Quality metric 3: Percent of valid episodes with filled ACE-inhibitor during the episode window and 30 days before the episode. The codes used to identify follow-up care procedures are listed in the configuration file under “Quality Metric 03 ACE-inhibitor.”

■ **Quality metrics not tied to gain sharing for acute CHF exacerbation episodes:**

- Quality metric 4: Percent of valid episodes where there is a readmission (not including acute rehabilitation) within 30 days of discharge or return

home. The codes used to identify admission on inpatient and outpatient claims are listed in the configuration file under “Quality Metric 04 Admission.”

- Quality metric 5: Percent of valid episodes where the patient receives cardiac rehabilitation within the 90 days of discharge or return home. The codes used to identify cardiac rehabilitation on outpatient and professional claims are listed in the configuration file under “Quality metric 05 Cardiac Rehabilitation.”
- Quality metric 6: Percent of valid episodes with a filled prescription for Spironolactone or Eplerenone during the post-trigger window. The codes used to identify Spironolactone and Eplerenone are listed in the configuration file under “Quality Metric 06 Spironolactone and Eplerenone.”

2.3.8 Risk adjustment

Principal Accountable Providers (PAPs) participating in episode-based payment models are compared based on their performance on quality metrics and based on the average spend for episodes treated by each PAP. The credibility and effectiveness of an episode-based payment model therefore rests on the comparability and fairness of the episode spend measure used in the comparisons. Risk adjustment is one of several mechanisms that episode-based payment models may use to achieve comparability in episode spend across PAPs.

Risk adjustment specifically captures the impact on episode spend of documented clinical risk factors that typically require additional care during an episode and are outside the control of the PAP. The goal of risk adjustment is to account for different levels of medical risk across patient panels and, by doing so, reduce incentives for tactical selection of patients (i.e., avoiding riskier and more costly patients) when payments are tied to episode spend performance.

Risk factors and risk coefficients are identified in an iterative process informed by medical best practice, expert opinion, and statistical testing. The risk coefficients are used to calculate a risk score for each episode given the risk factors that are present for the episode. The risk score represents the ratio of the expected episode spend when no risk factors are present to the expected episode spend given the set of risk factors present for the episode. Multiplying the observed episode spend by the risk score results in the risk-adjusted episode

spend. Risk-adjusted episode spend represents how much spend would have been incurred during the episode had there been no risk factors present, all other things being equal. By minimizing the effect of clinically documented medical risk that is outside the control of the PAP on episode spend, risk-adjustment contributes to the fairness of the episode spend comparisons that underlie episode-based payment models.

For additional details on the risk adjustment process, please refer to the document “Supporting documentation on episode risk adjustment.”

This process was conducted as part of episode design by the Ohio Department of Medicaid. Risk factors and coefficients derived from this process are included in the accompanying configuration file. At this time it is not expected that individual payers run their own risk adjustment process for the Ohio Medicaid population.

Different risk factors apply for the acute CHF exacerbation episodes.

- Risk factors for acute CHF exacerbation:
 - Age 19-29
 - Cardiac Circulatory Congenital Anomalies
 - Coagulation and hemorrhagic disorders
 - Conduction disorders
 - Coronary artery disease
 - Heart valve disorders
 - Other Arrhythmias
 - Pacemaker and Defibrillator
 - Ventricular Tachycardia

Except for the age ranges, risk factors have to be present during the episode window or during the 365 days before the episode window. Member age is defined in the glossary. The risk coefficients associated with each risk factor are listed as parameters in the configuration file under “Risk Adjustment.”

2.3.9 Gain and risk sharing

The State of Ohio and the MCPs will send provider reports to PAPs to inform them about their performance in the episode-based payment model. A

detailed description of the provider reports is beyond the scope of the Detailed Business Requirements. Please refer to the “Episode of Care Payment Report Sample” provided separately as a general guide for the layout and metrics of the provider reports.

At some point after thresholds are set, provider reports will include gain/risk sharing information. Gain/risk sharing is determined based on the comparison of the average risk-adjusted episode spend for valid episodes of each PAP to three pre-determined thresholds. The thresholds and relevant calculations are detailed below. Note that, throughout this section, the average risk-adjusted episode spend for valid episodes will be referred to as the ‘average risk-adjusted spend’:

- **Acceptable threshold:** PAPs with an average risk-adjusted spend above the acceptable threshold and that also have a minimum of five valid episodes during the performance period owe a risk-sharing payment.
- **Commendable threshold:** PAPs with an average risk-adjusted spend between the commendable threshold and above the gain sharing limit threshold that also have a minimum of five valid episodes and pass the quality metrics tied to gain sharing during the performance period receive a gain sharing payment.
- **Gain sharing limit threshold:** PAPs with average risk-adjusted spend below the gain sharing limit threshold that also have a minimum of five valid episodes and pass the quality measures tied to gain sharing receive a gain sharing payment that is proportional to the difference between the commendable threshold and the gain sharing limit as a percentage of average risk-adjusted episode spend.

PAPs with average risk-adjusted episode spend between the acceptable and commendable thresholds may neither owe a risk sharing payment nor receive a gain sharing payment.

The gain or risk sharing payment of each PAP is calculated based on episodes that ended during a performance period of a certain length (e.g., 12 months). The calculation of the gain or risk sharing payment is as follows (Exhibit 4):

- **Risk sharing:** The calculation of the risk-sharing amount involves multiplying the percentage of spend subject to risk-sharing by the total non-risk-adjusted episode spend for all valid episodes of the PAP and the risk-sharing proportion (e.g., 50%). The percentage of spend subject to risk-

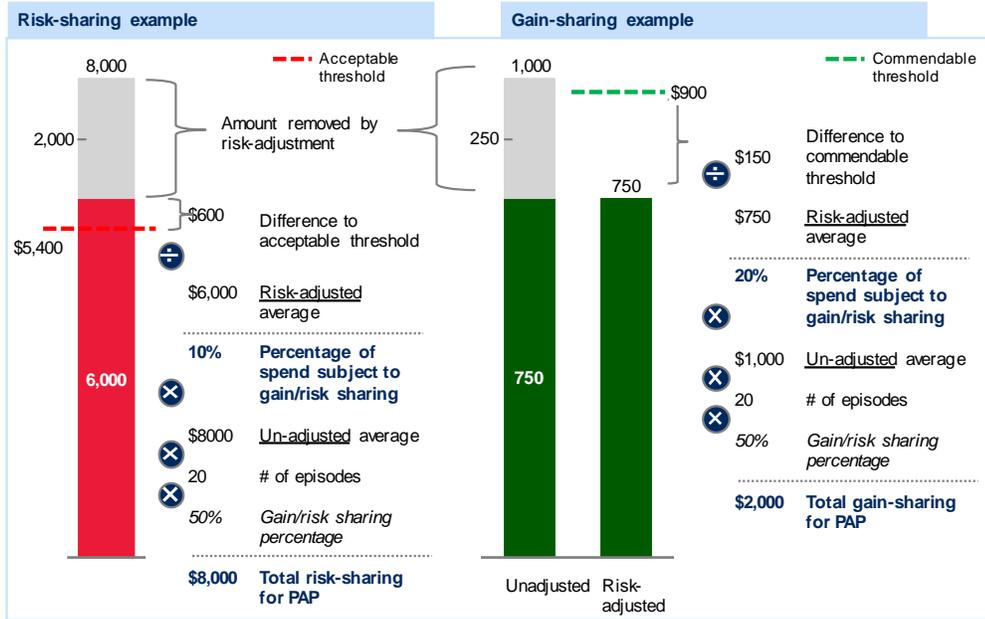

sharing is the difference between the PAP's risk-adjusted spend and the acceptable threshold as a percentage of the PAP's risk-adjusted spend.

- **Gain sharing:** The calculation of the gain-sharing amount involves multiplying the percentage of spend subject to gain sharing by both a PAP's total non-risk-adjusted episode spend for valid episodes and the gain-sharing proportion (e.g., 50%). The calculation of the percentage of spend subject to gain sharing depends on whether the PAP's average risk-adjusted spend is above or below the gain-sharing limit:
 - If a PAP's average risk-adjusted spend is above the gain sharing limit, the percentage of spend subject to gain-sharing is the difference between the PAP's average risk-adjusted spend and the commendable threshold as a percentage of the PAP's average risk-adjusted spend.

If the PAP's average risk-adjusted spend is below the gain sharing limit, the percentage of spend subject to gain sharing is the difference between the gain sharing limit and the commendable threshold as a percentage of the PAP's average risk-adjusted spend.

EXHIBIT 6 – CALCULATION OF RISK- AND GAIN-SHARING PAYMENTS

ILLUSTRATIVE EXAMPLE

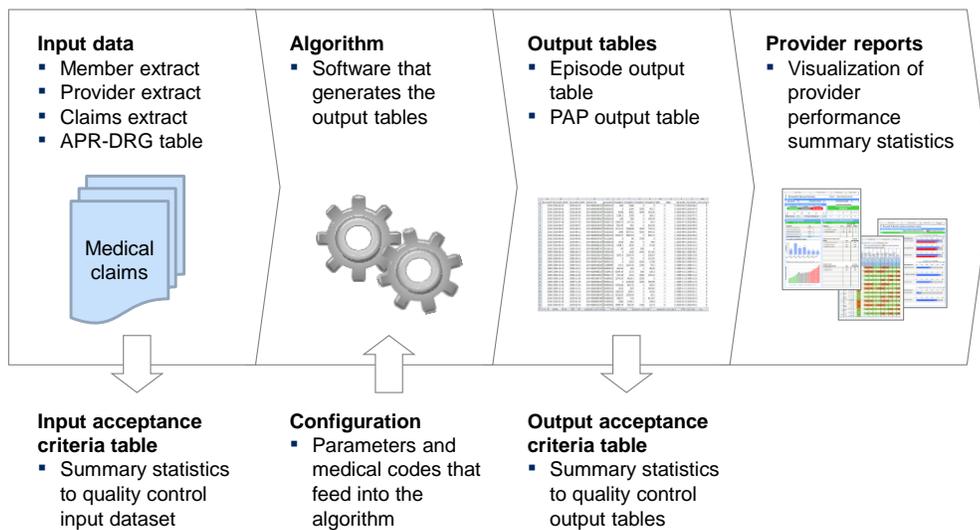

3. EPISODE DATA FLOW

The analytics underlying an episode-based payment model are performed by an episode algorithm. The algorithm takes an input dataset, transforms the data in accordance with the intent of the episode design, and produces a set of output tables (Exhibit 7). The output tables are used to create provider reports.

Several of the episode design dimensions require input parameters such as age ranges and medical codes such as diagnosis, procedure, and medication codes to specify the intent of the episode. The parameters and medical codes are provided in the episode configuration.

It is recommended that the episode data flow include two elements for quality assurance: (1) An input acceptance criteria table to assess the content and quality of the input dataset. (2) An output acceptance criteria table to assess the content and quality of the output tables. It is the responsibility of each payer to determine the details of appropriate quality assurance measures.

EXHIBIT 4 – EPISODE DATA FLOW

3.1 Input data

To build an episode, the following input data are needed:

- **Member Extract:** List of patients and their health insurance enrollment information.
- **Provider Extract:** List of participating providers and their addresses.
- **Claims Extract:** Institutional claims (UB-04 claim form), professional claims (CMS1500 claim form), and pharmacy claims (NCPDP claim form) at the patient level.
- **APR-DRG Base Rate Table:** Table containing the APR-DRG base rate for each DRG-paid provider.

The table below lists the required input fields using the source field abbreviations and source table names provided in the Ohio Vendor Extracts Companion Guides. The algorithm logic (section 4) describes the use of each input field. In the algorithm logic, input fields are referred to by the “Source field name in DBR” and written in italics.

Table – Input fields

APR-DRG Base Rate Table		
Provider ID	Medicaid Provider ID	APR DRG Base Rates to Plans.xlsx
Base Rate	Base Rate	APR DRG Base Rates to Plans.xlsx

The date range for the input data has to include the 12 months duration reporting period as well as the 15 months preceding the reporting period. The 15 months preceding the reporting period are needed to allow for identification of risk factors and comorbidities as well as to provide sufficient input data to identify the episode start date for the first episodes that end during the reporting period.

The input data includes claims from the payer responsible for the episode as well as historical claims from other Medicaid payers prior to the episode trigger. Payers are provided with this claims data upon member enrollment. The

inclusion of this data is particularly important in generating appropriate risk factors and exclusions.

Historical data should be treated exactly the same as claims that were submitted directly to the payer with one exception: Payers should only report on episodes for which they paid the triggering claim in order to avoid double-counting of episodes across plans.

The input data has to contain only unique and paid claims. It is the responsibility of each payer to apply appropriate methods to ensure that all claims in the input data are valid, de-duplicated, and paid. For Ohio Medicaid, the methods provided by the State are used to remove duplicate and void claims. The input fields *Header Paid Status* and *Detail Paid Status* are used to determine whether a claim or claim detail line was paid.

If the value of an input field from the Claims Extract that is required to build an episode is missing or invalid, then the corresponding claim is ignored when building the episode. For example, a claim that would be a potential trigger, but is missing the *Header From Date Of Service*, cannot be a potential trigger.

3.2 Episode algorithm

The intent of the episode algorithm is detailed in the algorithm logic (section 4) of the DBR.

3.3 Episode configuration

The parameters and medical codes needed to define an episode are listed in the configuration file which is provided as an attachment to the DBR. There is one configuration file for the acute CHF exacerbation episode. The files include:

- **Parameters sheet:** Values for parameters used in the episode, for example the outlier thresholds and risk coefficients.
- **Code sheet:** Medical codes used in the episode, for example trigger diagnosis or procedure codes and codes to identify included claims. Diagnosis and procedure codes may be provided as complete or incomplete codes. If an incomplete code is provided, the incomplete code itself as well as all complete codes that stem from it need to be taken into account when using the code.

The algorithm logic (section 4) explains the intended use of the parameters and medical codes by the episode algorithm. References to medical codes in the configuration file are made using the name for the relevant design dimension subcategory in the code sheet of the configuration file. References to parameters in the configuration file are made using the name for the relevant design dimension in the parameters sheet of the configuration file.

3.4 Output tables

Using the input data tables and the configuration file, an episode algorithm creates two output tables: the episode output table and the PAP output table. The algorithm logic (section 4) describes the definition of each output field. In the algorithm logic, output fields are referred to by the output field names provided in the tables below and are written in italics.

3.4.1 Episode output table

The episode output table contains the set of episodes identified by the algorithm and the characteristics of each episode. The table below lists the required output fields.

Table – Episode Output Table

Output field name	Output field abbreviation

Number of QMs depends on episode	

3.5 Provider reports

During the initial implementation phase, each PAP receives a report to inform them about their performance in the episode-based payment model. The information shown in the provider report is based on the episode and PAP output tables. The reports show episodes with an episode end date during the reporting period. A detailed description of the provider report is beyond the scope of the Detailed Business Requirements. Please refer to the “Episode of Care Payment Report Sample” provided separately as a general guide for the layout and metrics of the provider report.

4. ALGORITHM LOGIC

The algorithm logic forms the basis to code an episode algorithm. It explains the intent of the episode design at a level of granularity that will allow

an IT implementation team to create an algorithm that matches the episode design.

4.1 Identify episode triggers

The first design dimension of building an acute CHF exacerbation episode is to identify potential triggers.

Episode output fields created: *Trigger Claim ID, Member ID*

Potential triggers are identified over the entire date range of the input data. For the acute CHF exacerbation episodes, a potential trigger is defined as an inpatient or certain outpatient claim with a diagnosis indicating acute CHF exacerbation. Claim types (inpatient, outpatient, professional, and pharmacy) are identified based on the input field *Claim Type*. For the definition of each claim type see the glossary.

Three approaches are used to identify acute CHF exacerbation potential triggers:

- **Acute CHF exacerbation-specific trigger diagnosis codes:** A claim that originates from one of the trigger locations observation room, emergency department, IV infusion clinic, or inpatient is a potential trigger if it contains an acute CHF exacerbation-specific trigger diagnosis code in the input field *Header Diagnosis Code Primary*.
- **Acute CHF exacerbation-contingent trigger diagnosis codes:** A claim that originates from one of the trigger locations observation room, emergency department, IV infusion clinic, or inpatient is a potential trigger if both of the following conditions are met:
 - First, the claim contains a chronic heart failure trigger diagnosis code in the input field *Header Diagnosis Code Primary*
 - Second, the claim contains a confirming trigger diagnosis code in any of the input fields *Header Diagnosis Code 2-28*. A confirming trigger diagnosis code may be either:
 - An acute CHF exacerbation trigger diagnosis code
 - A signs and symptoms of CHF trigger diagnosis code
- **Acute CHF exacerbation-contingent trigger diagnosis codes:** A claim that originates from one of the trigger locations observation room,

emergency department, IV infusion clinic, or inpatient is a potential trigger if both of the following conditions are met:

- First, the claim contains a signs and symptoms of CHF trigger diagnosis code in the input field *Header Diagnosis Code Primary*
- Second, the claim contains a confirming trigger diagnosis code in any of the input fields *Header Diagnosis Code 2-28*. A confirming trigger diagnosis code may be either:
 - An acute CHF exacerbation trigger diagnosis code
 - A chronic heart failure trigger diagnosis code

Note that the above logic implies that an acute CHF exacerbation-contingent diagnosis codes requires the presence of diagnoses from at least two distinct code lists in order to identify a potential trigger.

The acute CHF diagnosis codes, chronic heart failure diagnosis codes, and signs and symptoms of CHF diagnosis codes are listed in the configuration file under “Trigger Diagnosis Codes – Acute CHF,” “Trigger Diagnosis Codes – Chronic CHF,” and “Trigger Diagnosis Codes – Signs and Symptoms of CHF.”

The trigger location inpatient is based on the input field *Claim Type*. The trigger locations observation room, emergency department, and IV infusion clinic are defined using the input field *Revenue Code*. If the *Revenue Code* on one or more claim detail lines with a *Claim Type* of outpatient matches a revenue code listed under “Trigger Revenue Codes” in the configuration file, then the claim is considered to be an observation room, emergency department, or IV infusion clinic.

The output field *Trigger Claim ID* is set to the input field *Internal Control Number* of the inpatient or outpatient claim that identifies a potential trigger. The output field *Member ID* is set to the input field *Member ID* of the inpatient or outpatient claim that identifies a potential trigger.

Potential triggers that are identified based on an outpatient claim start on the minimum *Detail From Date Of Service* and end on the maximum *Detail To Date Of Service* of the outpatient claim detail line(s) containing revenue codes for relevant trigger locations. Potential triggers that are identified based on an inpatient claim start on the *Header From Date Of Service* of the first inpatient claim in the hospitalization and end on the *Discharge Date* of the last inpatient claim of the hospitalization.

An inpatient facility claim overlaps with the outpatient claim detail line if all of the following are true:

- The inpatient claim has a *Header From Date Of Service* on or before (\leq) the input field *Detail From Date Of Service* of the triggering outpatient claim detail line(s).
- The inpatient claim has a *Discharge Date* on or after (\geq) the input field *Detail To Date Of Service* of the triggering outpatient claim detail line.

A specific rule applies for potential triggers that are identified based on inpatient claims that are part of a hospitalization consisting of two or more inpatient claims. For the definition of hospitalizations see the glossary. If an inpatient claim that identifies a potential trigger is part of a hospitalization consisting of two or more inpatient claims, the potential trigger starts on the *Header From Date Of Service* of the chronologically first inpatient claim during the hospitalization and ends on the *Discharge Date* of the chronologically last inpatient claim (with or without a trigger diagnosis code) of the hospitalization. The output fields *Trigger Claim ID* and *Member ID* are set using the *Internal Control Number* and *Member ID* of the earliest inpatient claim with a trigger diagnosis code during the hospitalization.

Once all potential triggers have been identified, the preliminary start and end dates for each potential trigger can be extended if they overlap with another hospitalization. In order for an extension to occur, the hospitalization must meet one of the following conditions:

- The preliminary potential trigger start and end dates both occur between the hospitalization start and end dates
- The preliminary potential trigger start date occurs between the hospitalization start date and 1 day before the hospitalization end date
- The hospitalization start date occurs between the preliminary potential trigger start date and 1 day before the preliminary potential trigger end date, and the hospitalization end date occurs after the preliminary potential trigger end date.

This extension is possible even if the trigger claim (and associated facility claim, if applicable to the episode) does not have a *Claim Type* of inpatient, as long as the trigger logic does not explicitly prohibit episodes to trigger during an inpatient stay. An overlapping hospitalization cannot result in the shortening of the preliminary potential trigger duration.

For the definition of hospitalizations see the glossary. The extension logic only applies to the first overlapping hospitalization. Additional extension is not allowed if the extended potential trigger window overlaps with another hospitalization.

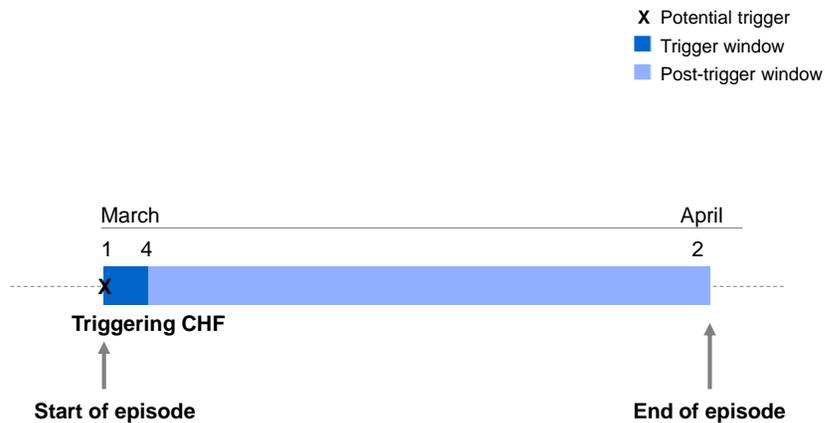

4.2 Determine the episode duration

The second design dimension of building an acute CHF exacerbation episode is to define the duration of the episode and to assign claims and claim detail lines to each episode.

Episode output fields created: *Trigger Window Start Date, Trigger Window End Date, Post-trigger Window Start Date, Post-trigger Window End Date, Episode Start Date, Episode End Date*

Two time windows are of relevance in determining the episode duration (see Exhibit 8 & 9).

EXHIBIT 8 – ACUTE CHF EXACERBATION EPISODE DURATION

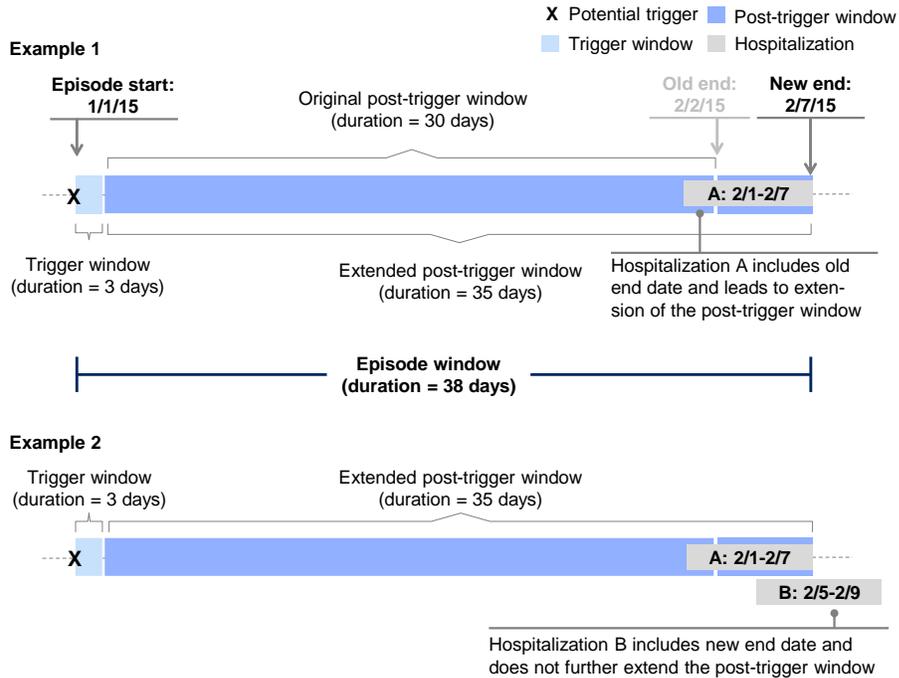

- **Pre-trigger window:** The acute CHF exacerbation episode does not have a pre-trigger window.

- **Trigger window:** The output fields *Trigger Window Start Date* and *Trigger Window End Date* are set using the potential trigger start and end dates which are defined in section 4.1. The output field *Trigger Window Start Date* is also the output field *Episode Start Date*. Only potential triggers that constitute a trigger acute CHF exacerbation can set the duration of a trigger window. The approach to determine whether a potential trigger is a trigger acute CHF exacerbation is described below.
- **Post-trigger window:** The output field *Post-trigger Window Start Date*, is set to the day after the output field *Trigger Window End Date*. The output field *Post-trigger Window End Date* is set to the 30th day after the output field *Trigger Window End Date* (for a post-trigger window of 30 days duration). If a hospitalization is ongoing on what would be the final day of the post-trigger window, the output field *Post-Trigger Window End Date* is instead set to the input field *Discharge Date* of the hospitalization. A hospitalization is ongoing on the final day of the post-trigger window if the hospitalization has an input field *Header From Date Of Service* during the trigger window or during the first 30 days of the post-trigger window and a *Discharge Date* beyond the first 30 days of the post-trigger window. If more than one hospitalization is ongoing on the 30th day of the post-trigger window, the latest *Discharge Date* present on a hospitalization sets the end date of the post-trigger window. Hospitalizations are defined in the glossary. The output field *Post-trigger Window End Date* is also the *Episode End Date*.

The extension of an episode due to a hospitalization may not lead to further extensions of the episode, i.e., if the post-trigger window is set based on the *Discharge Date* of a hospitalization and a different hospitalization starts during the extension of the post-trigger window and ends beyond it the episode is not extended a second time (Exhibit 10).

EXHIBIT 10 – EPISODE EXTENSIONS

The combined duration of the trigger window and post-trigger window is the episode window. All time windows are inclusive of their first and last date. For the definition of how the duration of time windows is calculated see the glossary.

The logic that determines the duration of the episode window assigns potential triggers to one of two groups:

- **Trigger acute CHF exacerbation:** Potential triggers that do not occur during another episode constitute the trigger window of a new episode.
- **Repeat acute CHF exacerbation:** Potential triggers that occur during the post-trigger window of an episode do not constitute the trigger window for a new episode.

To define episode windows for each patient a chronological approach is taken. The first trigger acute CHF exacerbation of a given patient is identified as the earliest (i.e., furthest in the past) potential trigger in the input data. Once the first trigger acute CHF exacerbation for a patient has been identified, the trigger window and the post-trigger window are set. Any potential triggers that fall into the post-trigger window are classified as repeat acute CHF exacerbation. The next potential trigger that starts outside of the post-trigger window constitutes

the second trigger acute CHF exacerbation for a given patient. The process of setting episode windows continues for each patient until the last episode window that ends during the input data date range is defined. Note that the input data begins 15 months prior to the reporting window, so potential triggers may be repeat acute CHF exacerbation, and thus not trigger an acute CHF exacerbation, of episodes that ended prior to the reporting period .

The following special cases may occur when determining the episode duration:

- If two or more potential triggers of the same patient overlap, i.e., the start date of one potential trigger falls between the start date and the end date (inclusive) of one or more other potential triggers of the same patient, then only one of the overlapping potential triggers is chosen as a trigger acute CHF exacerbation or repeat acute CHF exacerbation. The other overlapping potential triggers do not count as trigger acute CHF exacerbation or repeat acute CHF exacerbation, but are treated like any other claims. The following hierarchy is applied to identify the one potential trigger out of two or more overlapping potential triggers that is assigned as a trigger acute CHF exacerbation or repeat acute CHF exacerbation:
 - The potential trigger with the earliest start date has highest priority.
 - If there is a tie, the potential trigger based on an inpatient claim is selected.
 - If there is a tie, the potential trigger with an CHF-specific trigger diagnosis is selected.
 - If there is a tie, the potential trigger with the latest end date is selected.
 - If there is still a tie, the potential trigger with the lowest *Trigger Claim ID* is selected.
- If the start date of a potential trigger occurs during the post-trigger window of an episode but its end date is outside of the post-trigger window of the episode, the potential trigger is neither a repeat acute CHF exacerbation nor a trigger acute CHF exacerbation, and the claims in the potential trigger are treated like any other claims.

To determine which claims and claim detail lines occur during an episode and before an episode the following assignment rules are used. In addition, specific rules apply to assign claims and claim detail lines to windows during the episode (the trigger window, the post-trigger window, and hospitalizations).

- **Assignment to the episode window:**

- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the episode window if both the input field *Header From Date Of Service* and the input field *Discharge Date* of the hospitalization occur during the episode window.
 - Outpatient, and professional claims are assigned to the episode window if at least one of their claim detail lines is assigned to the episode window. Outpatient and professional claim detail lines are assigned to the episode window if both input field *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the episode window.
 - Pharmacy claims and all their claim detail lines are assigned to the episode window if both input fields *Header From Date Of Service* and *Header To Date Of Service* occur during the episode window.
- **Assignment to a window before the episode:**
- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to a window before the episode (e.g., 365 days to 1 day before the output field *Episode Start Date*, 90 days to 1 day before the *Episode Start Date*) if the input fields *Header From Date Of Service* and *Header To Date Of Service* the hospitalization occurs during the specified time window before the output field *Episode Start Date*.
 - Outpatient and professional claims are assigned to a window before the episode if all their claim detail lines are assigned to the window before the episode. Outpatient and professional claim detail lines are assigned to a window before the episode if the input field *Detail From Date Of Service* occurs during the specified time window before the output field *Episode Start Date*.
 - Pharmacy claims and all their claim detail lines are assigned to a window before the episode if the input field *Header From Date Of Service* occurs during the specified time window before the *Episode Start Date*.
- **Assignment to the trigger window:**
- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the trigger window if both the input field *Header From Date Of Service* and the input field *Discharge Date* of the hospitalization occur during the trigger window.

- Outpatient and professional claims are assigned to the trigger window if all their claim detail lines are assigned to the trigger window. Outpatient and professional claim detail lines are assigned to the trigger window if both the input fields *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the trigger window.
- Pharmacy claims and all their claim detail lines are assigned to the trigger window if both the input fields *Header From Date Of Service* and the *Header To Date Of Service* occur during the trigger window.
- **Assignment to the post-trigger window:**
 - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the post-trigger window if the hospitalization is assigned to the episode window and also has input fields *Header From Date Of Service* and *Discharge Date* during the post-trigger window.
 - Outpatient, and professional claims are assigned to the post-trigger window if at least one of their claim detail lines is assigned to the post-trigger window. Outpatient and professional claim detail lines are assigned to the post-trigger window if they are assigned to the episode window and also have an input field *Detail To Date Of Service* during the post-trigger window.
 - Pharmacy claims and all their claim detail lines are assigned to the post-trigger window if they are assigned to the episode window and also have an input field *Header To Date Of Service* during the post-trigger window.

4.3 Identify claims included in episode spend

The third design dimension of building an acute CHF exacerbation episode is to identify which claims and claim detail lines are included in the calculation of episode spend. For short, such claims or claim detail lines are referred to as included claims or included claim detail lines. Claims or claim detail lines that are excluded from the calculation of episode spend are referred to as excluded claims or excluded claim detail lines.

Episode output fields created: *Count Of Included Claims*

Different rules for the inclusion of claims and claim detail lines apply to claims and claim detail lines assigned to the trigger window and the post-trigger

window. The assignment of claims and claim detail lines to windows during the episode is detailed in section 4.2.

- **Pre-trigger window:** The acute CHF exacerbation episode does not have a pre-trigger window.
- **Trigger window:** All inpatient, outpatient, professional, and pharmacy claims and claim lines that occur during the trigger window are included claims.
- **Post-trigger window:** For claims and claim detail lines assigned to the post-trigger window, a hierarchy is applied to identify included claims and included claim detail lines for acute CHF exacerbation episodes:
 - First, included hospitalizations are identified. If an inpatient claim assigned to the post-trigger window includes a relevant diagnosis code in the input field *Header Diagnosis Code Primary*, then all claim detail lines of the claim are included claim detail lines. If an inpatient claim assigned to the post-trigger window includes a complication diagnosis code in the input field *Header Diagnosis Code Primary* and a diagnosis code from either chronic or acute heart failure in the *Header Diagnosis Code 2-28*, then all claim detail lines of the claim are included claim detail lines. The configuration file lists relevant diagnosis codes, complication diagnosis codes, chronic heart failure, and acute heart failure under “Relevant Diagnoses,” “Included Complication Diagnoses,” “Trigger Diagnosis Codes – Chronic CHF,” and “Trigger Diagnosis Codes – Acute CHF.”
 - Pharmacy claims as well as outpatient, and professional claim detail lines that are assigned to the post-trigger window are checked for included procedures, included E&M, included medications, included complication diagnoses, and relevant diagnoses.
 - Included medical procedures: If an outpatient or professional claim detail line assigned to the post-trigger window contains a procedure code for a specific imaging, testing, pathology, or other related procedure in the input field *Detail Procedure Code*, then the claim detail line is an included detail line. The configuration file lists included procedure codes under “Included Procedures.” For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.

- Included E&M care: If an outpatient or professional claim detail line assigned to the post-trigger window contains a procedure code for an E&M visit in the input field *Detail Procedure Code* and a relevant acute CHF diagnosis code in the input field *Header Diagnosis Code Primary*, then the claim detail line is an included claim detail line. The configuration file lists included E&M codes and relevant diagnosis codes under “Included E&M” and “Trigger Diagnosis Codes – Acute CHF,” respectively. For outpatient claims, all other claim detail lines on the same claim with the same input fields *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
 - Included medications: If a pharmacy claim assigned to the post-trigger window contains an included medication code in the input field *HIC3 Code* then the claim is an included claim. The configuration file lists included medications under “Included Medications” using Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank.
 - Included diagnoses: If an outpatient or professional claim are assigned to the post-trigger window contains an included complication diagnosis or another relevant diagnosis code in the input field *Header Diagnosis Code Primary*, then all claim detail lines of the claim are included claim detail lines. The configuration file lists included complication diagnosis codes and relevant diagnosis codes under “Included Complication Diagnoses,” and “Included Other Relevant Diagnoses.”
- **Episode window:** Outpatient and professional claim detail lines that are assigned to the episode window are checked for excluded procedures. These exclusions supersede any other reason a claim detail line might be included. The configuration file lists the codes under “Excluded Transportation Procedures.”
 - Excluded transportation: If an outpatient or professional claim detail line that is assigned to the episode window contains an excluded transportation procedure code in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line. The configuration file lists excluded transportation procedure codes under “Excluded Transportation Procedures.” This exclusion of claim detail lines takes precedence over any other inclusion logic.

- Exclude vaccinations: If an outpatient or professional claim detail line that is assigned to the episode window contains an excluded vaccination procedure code in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line. The configuration file lists excluded transportation procedure codes under “Excluded Vaccination Procedures.” This exclusion of claim detail lines takes precedence over any other inclusion logic.
- Not included claims: Any claim or claim detail line not explicitly included during the episode window is an excluded claim or excluded claim detail line.

The output field *Count Of Included Claims* is defined as the number of unique claims that contribute to episode spend. For the purpose of calculating counts of claims, a claim is counted as contributing to episode spend if it is an included claim or if one or more of its claim detail lines are included claim detail lines. The output field *Count Of Included Claims* is calculated overall as well as broken out by claim type, by window during the episode, and by claim type and window during the episode. Breakouts by window are calculated based on the window to which each claim is assigned.

4.4 Calculate non-risk adjusted episode spend

The fourth design dimension of building an acute CHF exacerbation episode is to calculate the non-risk-adjusted spend for each episode.

Episode output fields created: *Non-risk-adjusted Episode Spend, Normalized-non-risk-adjusted Episode Spend*

PAP output fields created: *Average Non-risk-adjusted PAP Spend, Total Non-risk-adjusted PAP Spend*

The *Non-risk-adjusted Episode Spend* is defined as the sum of:

- The spend for included, header-paid inpatient claims. The spend for each included, header-paid inpatient claim is calculated as the value in the input field *DRG Base Payment* plus the values in the input fields *DRG Outlier Payment A* and *DRG Outlier Payment B*. Header-paid inpatient claims are identified based on an input field *Header Or Detail Indicator* of ‘H’. Other components of the DRG payment are not taken into account. Ohio Medicaid has a methodology to derive this clinical component of care for relevant

encounters using the relative weights for each DRG-SOI combination and hospital rates as posted on the Ohio Medicaid website (<http://medicaid.ohio.gov/PROVIDERS/FeeScheduleandRates/SchedulesandRates.aspx#1682575-inpatient-hospital-services>).

- The spend for included, detail-paid inpatient claims. The spend for each included, detail-paid inpatient claim is calculated as the sum of the input fields *Detail Paid Amount* for claims from MCPs and the sum of the inputs fields *Detail Allowed Amount* for claims from FFS.
- The *Header Paid Amount* of included pharmacy claims from MCPs.
- The *Header Allowed Amount* of included pharmacy claims from FFS.
- The *Detail Paid Amount* for included outpatient and professional claim detail lines from MCPs.
- The *Detail Allowed Amount* for included outpatient and professional claim detail lines from FFS.

Claims from MCPs and FFS are distinguished based on the input field *FFS Or MCP Indicator*. A value of ‘E’ in the input field *FFS Or MCP Indicator* indicates an MCP claim; a value of ‘F’ indicates a FFS claim. The output field *Non-risk-adjusted Episode Spend* is calculated overall and broken out by claim type, by window during the episode, and by claim type and window during the episode.

The *Normalized-non-risk-adjusted Episode Spend* is defined as the sum of:

- The normalized spend for included, header-paid inpatient claims. The normalized spend for each included, header-paid inpatient claim is calculated as the value in the input field *DRG Base Payment* multiplied by the ratio of the *Normalized Base Rate* to the *Base Rate* plus the values in the input fields *DRG Outlier Payment A* and *DRG Outlier Payment B*. The configuration file lists the *Normalized Base Rate* as a parameter under “Episode Spend.” The *Base Rate* is determined by looking up the appropriate value in the input field *Base Rate* from the APR-DRG Base Rate Table using the input field *Provider ID* to link to the *Billing Provider ID* of each included, header-paid inpatient claim. Header-paid inpatient claims are identified based on a *Header Or Detail Indicator* of ‘H’. Other components of the DRG payment are not taken into account.
- The spend for included, detail-paid inpatient claims. The spend for each included, detail-paid inpatient claim is calculated as the sum of the input

fields *Detail Paid Amount* for claims from MCPs and the sum of the inputs fields *Detail Allowed Amount* for claims from FFS.

- The *Header Paid Amount* of included pharmacy claims from MCPs.
- The *Header Allowed Amount* of included pharmacy claims from FFS.
- The *Detail Paid Amount* for included outpatient and professional claim detail lines from MCPs.
- The *Detail Allowed Amount* for included outpatient and professional claim detail lines from FFS.

If a claim detail line is included for two or more reasons (e.g., due to an included diagnosis and an included procedure), its *Detail Allowed Amount* or *Detail Paid Amount* counts only once towards the *Non-risk-adjusted Episode Spend* or the *Normalized-non-risk-adjusted Episode Spend*.

For the provider reports, the fields *Average Non-risk-adjusted PAP Spend* and *Total Non-risk-adjusted PAP Spend* are added to the PAP output table. *Average Non-risk-adjusted PAP Spend* is calculated as the average of the *Non-risk-adjusted Episode Spend* across valid episodes for a given PAP. *Total Non-risk-adjusted PAP Spend* is calculated as the sum of the *Non-risk-adjusted Episode Spend* across valid episodes for a given PAP. See section 4.5 for the identification of PAPs and section 4.6 for the definition of valid episodes.

The *Average Non-risk-adjusted PAP Spend* is shown overall as well as broken out by claim type, by window during the episode, and by claim type and window during the episode. The breakouts of *Average Non-risk-adjusted PAP Spend* are calculated in two ways:

- Breakout A: The averages are calculated across all valid episodes of a PAP.
- Breakout B: The averages are calculated across valid episodes of a PAP that have spend greater zero dollars (>\$0) in the category that is broken out.

For example, a PAP has 100 valid episodes and 80 of the episodes have any inpatient spend, the remaining 20 do not have any inpatient spend. To calculate breakout A for *Average Non-risk-adjusted PAP Spend Inpatient*, the denominator is 100 valid episodes. To calculate breakout B for *Average Non-risk-adjusted PAP Spend Inpatient* the denominator is 80 valid episodes with any inpatient spend.

4.5 Identify Principal Accountable Providers

The fifth design dimension of building an acute CHF exacerbation episode is to assign each episode to a Principal Accountable Provider (PAP).

Episode output fields created: *PAP ID, PAP Name, Rendering Provider ID, Rendering Provider Name*

PAP output fields created: *PAP ID, PAP Name, PAP Address Line 1, PAP Address Line 2, PAP City, PAP State, PAP Zip Code*

The output field *PAP ID* is set using the input field *Billing Provider ID* on the facility claim that is used to set the output field *Trigger Claim ID*.

The output field *Rendering Provider ID* is set using the input field *Rendering Provider ID* of the claim that is used to set the output field *Trigger Claim ID*.

The output fields *PAP Name, PAP Address Line 1, PAP Address Line 2, PAP City, PAP State, and PAP Zip Code* are set based on the Provider Extract input fields *Provider Name, Practice Address Line 1, Practice Address Line 2, Practice City, Practice State, and Practice Zip Code*, respectively. The output fields are linked to the Provider Extract by matching the output field *PAP ID* to the input field *Provider ID* of the Provider Extract.

The output field *Rendering Provider Name* is set based on the Provider Extract input field *Provider Name*. The output field is linked to the Provider Extract by matching the output field *Rendering Provider ID* to the input field *Provider ID* of the Provider Extract.

4.6 Identify excluded episodes

The sixth design dimension of building an acute CHF exacerbation episode is to identify episodes that are excluded from the episode-based payment model.

Episode output fields created: *Any Exclusion, Exclusion Inconsistent Enrollment, Exclusion Multiple Payers, Exclusion Third-party Liability, Exclusion Dual Eligibility, Exclusion Exempt PAP, Exclusion PAP Out Of State, Exclusion No PAP, Exclusion Long Hospitalization, Exclusion Long-term Care, Exclusion Missing DRG, Exclusion Incomplete Episode, Exclusion FQHC RHC, Exclusion Inpatient Admissions, Exclusion Age, Exclusion Left Against Medical*

Advice, Exclusion Death, Exclusion <Comorbidity Name>, Exclusion Multiple Other Comorbidities, Exclusion High Outlier

Each *Exclusion <name of exclusion>* output field indicates whether an episode is excluded for a given reason and therefore invalid for the purpose of the episode based payment model. If an episode is excluded for more than one reason each exclusion is indicated. The output field *Any Exclusion* indicates whether an episode contains any exclusion. Episodes may be excluded for business reasons, for clinical reasons, or because they are outliers. After all exclusions have been applied, a set of valid episodes remains.

Business exclusions

- **Concurrent Scope:** For acute CHF exacerbation episodes, an episode is excluded if the patient has a concurrent CABG, VALVE, or PCI procedure during the trigger window. A concurrent procedure can be identified by an a CPT or HCPCS detail procedure code in the input field *Detail Procedure Code* on professional or outpatient claims or a header surgical procedure code in input fields *Surgical Procedure Code Primary* and *Surgical Procedure Code 2-24* on inpatient claims, indicating a CABG, VALVE, or PCI procedure. The configuration file lists these procedure codes under “Business Exclusions - PCI,” “Business Exclusions - CABG,” and “Business Exclusions - VALVE.”
- **Dual eligibility:** An episode is excluded if the patient had dual coverage by Medicare and Medicaid during the episode window. Dual coverage is determined using the input fields *Eligibility Start Date* and *Eligibility End Date* from the Member Extract where the *Aid Category* indicates dual coverage. *Aid Category* codes that indicate dual coverage are listed in the configuration file under “Business Exclusions – Duals.” Note that only the first digit of the *Aid Category* code is used for this purpose.

A patient is considered to have dual coverage during the episode window if the patient’s *Eligibility Start Date* for dual coverage falls before or on (\leq) the *Episode End Date* and the *Eligibility End Date* for dual coverage falls on or after (\geq) the *Episode Start Date*. The input field *Member ID* is linked to the output field *Member ID* from the Member Extract to identify the enrollment information for each patient.

If a patient has an *Eligibility Start Date* without a corresponding *Eligibility End Date* for dual coverage, the dual coverage is considered to be ongoing through the last date of the input data.

If a patient had dual coverage before or after the episode window, but not during the episode window, the episode is not excluded.

- **Exempt PAP:** An episode is excluded if either:
 - The provider type of the PAP is not a hospital. The values to identify hospitals based on the input field *Billing Provider Type* are listed in the configuration file under “Business Exclusions – Exempt PAP – Billing Provider Types”.
 - The PAP has a DRG-exempt specialty type. The values to identify DRG-exempt hospitals based on the input field *Billing Provider Specialty* are listed in the configuration file under “Business Exclusions – Exempt PAP – Specialty Types”.
- **FQHC/RHC:** An episode is excluded if the PAP is classified as a federally qualified health center or rural health clinic. The codes used to identify them are listed in the configuration file under “Business Exclusions – FQHC and RHC.”
- **Incomplete episodes:** An episode is excluded if the output field *Non-risk-adjusted Episode Spend* (not the *Risk-adjusted Episode Spend*) is less than (<) the incomplete episode threshold. The incomplete episode threshold is listed as a parameter in the configuration file under “Excluded Episodes.”
- **Inconsistent enrollment:** An episode is excluded if the patient was not continuously enrolled in Ohio Medicaid during the episode window. Enrollment is verified using the input fields *Eligibility Start Date* and *Eligibility End Date* from the Member Extract where the input field *Aid Category* indicates full Medicaid enrollment. *Aid Category* codes that indicate full Medicaid enrollment are listed in the configuration file under “Business Exclusions – Inconsistent Enrollment.” Note that only the first digit of the *Aid Category* code is used for this purpose.

A patient is considered continuously enrolled if the patient’s *Eligibility Start Date* for full Medicaid falls before or on (\leq) the *Episode Start Date* and the *Eligibility End Date* for full Medicaid falls on or after (\geq) the *Episode End Date*. The output field *Member ID* is linked to the input field *Member ID*

from the Member Extract to identify the enrollment information for each patient.

A patient may have multiple entries for *Eligibility Start Date* and *Eligibility End Date* for full Medicaid and some of the dates may be overlapping. In such cases, continuous, non-overlapping records of a patient's enrollment are created before confirming whether the patient was continuously enrolled during an episode. If a patient has an *Eligibility Start Date* without a corresponding *Eligibility End Date* for full Medicaid, enrollment is considered to be ongoing through the last date of the input data.

If a patient was not continuously enrolled in Ohio Medicaid before or after the episode window, but was continuously enrolled during the episode window, the episode is not excluded.

- **Long hospitalization:** An episode is excluded if a hospitalization that is assigned to the episode window has a duration greater than the threshold for long hospitalizations. The hospitalization may or may not be included in the episode spend. The long hospitalization threshold is listed as a parameter in the configuration file under "Excluded Episodes."
- **Long-term care:** An episode is excluded if the patient has one or more long-term care claim detail lines which overlap the episode window. A long-term care claim detail line which overlaps the episode window is defined as one with both a *Detail From Date Of Service* on or prior to (\leq) the *Episode End Date* and a *Detail To Date Of Service* on or after (\geq) the *Episode Start Date*. The long-term care claim may or may not be included in the episode spend.
- **Missing DRG:** An episode is excluded if a header-paid inpatient claim assigned to the episode window has an invalid or missing value in the input fields *APR-DRG* or *Severity Of Illness*. Header-paid inpatient claims are identified based on an output field *Header Or Detail Indicator* of 'H'.
- **Multiple payers:** An episode is excluded if a patient changes enrollment between MCPs during the trigger window or during the post-trigger window(s) (if applicable). Episodes are identified as having multiple payers if there is an inpatient, outpatient, professional, or pharmacy claim that meets all of the following conditions:
 - The claim is assigned to the trigger window or the post-trigger window of the episode (if applicable)
 - The input field *FFS Or MCP Indicator* of the claim is not "FFS"

- The input field *MCP ID* on the claim is not null and does not belong to the same payer that the episode is attributed to. Since a payer may be associated with multiple MCP IDs, the input field *MCP ID* must be cross-walked to a payer name. An updated crosswalk including current and historical MCP IDs must be used for each reporting period.

If a patient changes enrollment between MCPs during the pre-trigger window (if any) or before the episode window, it is the responsibility of the payer to whom the episode is attributed to utilize the claims history of the patient with the prior payer to build the episode. Attribution of an episode to a payer is defined in the glossary under “Payer Attribution.”

- **No PAP:** An episode is excluded if the PAP cannot be identified. A PAP cannot be identified if the input field *Billing Provider ID* is not available.
- **Non-acute episodes:** Any triggered episodes which are non-acute will be excluded. This exclusion requires both the absence of an acute CHF exacerbation diagnosis code on the triggering claim and the absence of the acute CHF exacerbation diagnosis on any confirming claims during the specified time window.
 - On the triggering inpatient or outpatient claims, the absence of Acute CHF exacerbation diagnosis codes are searched for in the input fields *Header Diagnosis Code Primary* and *Header Diagnosis Code 2-28* during the trigger window. The configuration file lists the codes used under “Trigger Diagnosis Codes – Acute CHF.”
 - On the confirming inpatient, outpatient, or professional claims, the absence of a diagnosis code for acute CHF exacerbation is searched for in the input fields *Header Diagnosis Code Primary* and *Header Diagnosis Code 2-28*. All claims that have at least one detail line in the trigger window should be included in the search. The configuration file lists the codes used under “Trigger Diagnosis Codes – Acute CHF.”
- **PAP out of state:** An episode is excluded if the PAP has a practice address outside of Ohio. The state of the practice address is determined using the output field PAP State. The code used to identify the state of Ohio is listed in the configuration file under “Business Exclusions – PAP Out Of State.”
- **Third-party liability:** An episode is excluded if either:

- An inpatient, outpatient, or professional claim that is assigned to the episode window is associated with a third-party liability amount. A claim is considered to be associated with a third-party liability amount if either the input field *Header TPL Amount* or any of the input fields *Detail TPL Amount* have a value greater than (>) zero. The claim with a positive TPL amount may or may not be included in the calculation of episode spend.

As an exception, a third party liability amount in the input field *Header TPL Amount* or the input field *Detail TPL Amount* of a professional FFS claim from an FQHC or RHC does not lead to exclusion of the episode if the episode is attributed to an MCP. Professional claims from FQHC or RHC are identified based on one or more detail lines that are assigned to the episode window and also have a *Place Of Service* of FQHC or RHC. The relevant values for *Place Of Service* are listed in the configuration file under “Business Exclusions – TPL Exempt Places of Service”. Claims from FFS are identified based on the input field *FFS Or MCP Indicator* having a value of ‘F’. Attribution of an episode to a payer is defined in the glossary under “Payer attribution”.

- A patient was enrolled with a relevant source of third party liability during the episode window. Enrollment is verified using the *TPL Effective Date* and *TPL End Date* from the Member Extract where the *Coverage Type* indicates relevant TPL coverage. *Coverage Type* codes that indicate relevant TPL are listed in the configuration file under “Business Exclusions – TPL Relevant Coverage”.

A patient is considered enrolled with a relevant source of TPL if the patient’s *TPL Effective Date* falls before or on (\leq) the *Episode End Date* and the *TPL End Date* falls on or after (\geq) the *Episode Start Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the enrollment information for each patient.

If a patient has a *TPL Effective Date* without a corresponding *TPL End Date* the enrollment with a relevant source of TPL is considered to be ongoing through the last date of the input data.

If a patient was enrolled with a relevant TPL source before or after the episode window, but was not enrolled during the episode window, the episode is not excluded.

Clinical exclusions

- **Age:** An episode is excluded if the output field *Member Age* does not fall into the valid age range or if it is invalid. See the glossary for the definition of *Member Age*. The valid age ranges for CHF episodes are listed as parameters in the configuration file under “Excluded Episodes.”
- **Comorbidity:** An episode is excluded if the patient has a comorbidity code during a specified time window. Each comorbidity exclusion listed in the configuration file sets a separate output field named *Exclusion <Name Of Comorbidity>*. For example, the HIV comorbidity exclusion sets the output field *Exclusion HIV* for all those episodes with evidence of HIV during the specified time period. The following approaches are used to identify comorbidities:
 - Comorbidity diagnosis codes are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims that are assigned to the specified time windows. The configuration file lists the codes and time windows under “Comorbidities <name of comorbidity> – Diagnoses.”
 - Comorbidity CCS codes are first converted into ICD-9 and ICD-10 diagnosis codes using the definition of the multi-level CCS categories for ICD-9 and ICD-10 diagnosis codes available from AHRQ (ICD-9 at <https://www.hcup-us.ahrq.gov/toolssoftware/ccs/ccs.jsp>, ICD-10 at <https://www.hcup-us.ahrq.gov/toolssoftware/ccs10/ccs10.jsp>). As with comorbidity diagnosis codes, the diagnosis codes associated with the Comorbidity CCS codes are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims that are assigned to the specified time windows. The configuration file lists the codes and time windows used under “Comorbidities <name of comorbidity> – CCS”.
 - Comorbidity CPT and HCPCS procedure codes are searched for in the input field *Detail Procedure Code* of outpatient and professional claim detail lines that are assigned to the specified time windows. The configuration file lists the codes and time windows used under “Comorbidities <name of comorbidity> – Procedures.”
 - Comorbidity ICD-9 and ICD-10 procedure codes are searched for in the input fields *Surgical Procedure Code Primary* and *Surgical Procedure Code 2-24* of inpatient claims that are assigned to the specified time

windows. The configuration file lists the codes and time windows used under “Comorbidities <name of comorbidity> – Procedures.”

- Comorbidity contingent cancer codes require both the presence of a cancer diagnosis code and also an indicator of active cancer treatment during the specified time window:
 - Cancer diagnosis codes are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer – Diagnoses.”
 - An indicator of active cancer treatment is the presence of either a diagnosis or procedure code for active cancer treatment during the specified time window. The indicator may occur on the same claim as a cancer diagnosis code or on a different claim. The following approaches are taken to identify active cancer treatment:
 - Diagnosis codes for active cancer treatment are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims that are assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer Active – Diagnoses.”
 - CPT and HCPCS codes for active cancer treatment are searched for in the input field *Detail Procedure Code* of outpatient and professional claim detail lines that are assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer Active – Procedures.”
 - ICD-9 and ICD-10 procedure codes for active cancer treatment are searched for in the input fields *Surgical Procedure Code Primary* and *Surgical Procedure Code 2-24* of inpatient claims that are assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer Active – Procedures.”

The claims and claim detail lines that are searched for comorbidities do not have to be included claims or included claim detail lines. If a patient lacked continuous eligibility during the year before the episode or during the episode window, comorbidities are checked in the data available.

- **Death:** An episode is excluded if either:
 - The patient has an input field *Patient Status Indicator* of “Expired” on any inpatient or outpatient claim assigned to the episode window. The claim may be an included claim or not. The values of the *Patient Status Indicator* used to identify whether the patient expired are listed in the configuration file under “Clinical Exclusions – Death.”
 - The input field *Date Of Death* in the Member Extract contains a date before or equal to the output field *Episode End Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the *Date Of Death* for each patient.
- **Left against medical advice:** An episode is excluded if the patient has an input field *Patient Status Indicator* of “Left Against Medical Advice or Discontinued Care” on any inpatient or outpatient claim assigned to the episode window. The claim may be an included claim or not. The value of the *Patient Status Indicator* used to identify whether the patient left against medical advice is listed in the configuration file under “Clinical Exclusions – Left Against Medical Advice.”
- **Multiple other comorbidities:** An episode is excluded if it is affected by too many risk factors to reliably risk adjust the episode spend. The output fields *Risk Factor <risk factor number>* as defined in section 4.8 are used to identify how many risk factors affect an episode. Each output field *Risk Factor <risk factor number>* indicates whether an episode is affected by one risk factor. If an episode is affected by more (>) risk factors than the value listed as a parameter in the configuration file under “Excluded Episodes,” the episode is excluded.

Outliers

- **High outlier:** An episode is excluded if the output field *Risk-adjusted Episode Spend* (not the *Non-risk-adjusted Episode Spend*) is above (>) the high outlier threshold. The high outlier thresholds for the acute CHF exacerbation episodes are listed as parameters in the configuration file under “Excluded Episodes.” See section 4.8 for the definition of *Risk-adjusted Episode Spend*.

4.7 Identify Principal Accountable Providers who pass the quality metrics

The seventh design dimension of building an acute CHF exacerbation episode is the calculation of the quality metrics and the identification of PAPs who meet the quality metrics performance requirement.

Acute CHF exacerbation episode output fields created: *Quality Metric 01 Indicator, Quality Metric 02 Indicator, Quality Metric 03 Indicator, Quality Metric 04 Indicator, Quality Metric 05 Indicator, Quality Metric 06 Indicator*

Acute CHF exacerbation PAP output fields created: *PAP Quality Metric 01 Performance, PAP Quality Metric 02 Performance, PAP Quality Metric 03 Performance, PAP Quality Metric 04 Performance, PAP Quality Metric 05 Performance, PAP Quality Metric 06 Performance*

Acute CHF exacerbation episodes have three quality metric that are tied to gain sharing and three informational quality metrics. Informational quality metrics are not tied to gain sharing.

Quality metric tied to gain-sharing for acute CHF exacerbation episodes:

■ **Quality metric 1: Follow-up Care Rate**

- The output field *Quality Metric 01 Indicator* marks episodes where any included claim in the post-trigger window contains relevant follow-up care. Claims containing relevant follow-up care are identified in two ways:
 - A professional claim that is assigned to the post-trigger window with a follow-up care procedure code in the input field *Detail Procedure Code* and a relevant diagnosis code in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* on the same claim. The follow-up care procedure codes and relevant diagnosis codes are both in the configuration file as “Quality Metric 01 Follow-Up Care Rate 30 Days.”
 - An inpatient or outpatient claim assigned to the trigger window with the absence of the discharge-to-home patient discharge status code in the input field *Patient Discharge Status*. The discharge-to-home patient discharge codes are in the configuration file under “Quality Metric 01 Follow-Up Care Rate 30 Days.”

- The output field *PAP Quality Metric 01 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP with at least one relevant follow-up visit during the post-trigger window, as indicated by the *Quality Metric 01 Indicator*
 - Denominator: Number of valid episodes of the PAP

■ **Quality metric 2: Beta blocker prescription**

- The *Quality Metric 02 Indicator* marks episodes with Beta blocker prescription during the episode window and 30 days before the episode. Episodes where the patient receives Beta blocker prescriptions are identified based on a pharmacy claim that has a Beta blocker medication in the input field *Detail National Drug Code* and is assigned to the episode window.

The configuration file lists the specific medications under “Quality Metric 02 Beta Blockers” using Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank. To search for specific medications, the HIC3 codes must be cross-walked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.

- The *PAP Quality Metric 02 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP with Beta blocker prescription in the episode window, as indicated by the *Quality Metric 02 Indicator*
 - Denominator: Number of valid episodes of the PAP

■ **Quality metric 3: ACE inhibitor prescription**

- The *Quality Metric 03 Indicator* marks episodes with ACE inhibitor prescription during the episode window and 30 days before the episode. Episodes where the patient receives ACE inhibitor prescriptions are identified based on a pharmacy claim that has an ACE inhibitor medication in the input field *Detail National Drug Code* and is assigned to the episode window.

The configuration file lists the specific medications under “Quality Metric 03 ACE Inhibitors” using Hierarchical Ingredient Code Level 3 (HIC3)

identifiers provided by First Databank. To search for specific medications, the HIC3 codes must be cross-walked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.

- The *PAP Quality Metric 03 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP with ACE inhibitor prescription in the episode window, as indicated by the *Quality Metric 03 Indicator*
 - Denominator: Number of valid episodes of the PAP

Quality metrics not tied to gain sharing for acute CHF exacerbation episodes (i.e., included for information only):

■ Quality metric 4: Readmission rate

- The output field *Quality Metric 04 Indicator* marks episodes where any included claim in the post-trigger window contains an admission that is not for acute rehabilitation. Claims containing an admission are identified in two ways:
 - An inpatient claim that contains one or more diagnosis codes for care after discharge in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* and the absence of the acute rehabilitation revenue codes in the input field *Revenue Code* on the same claim. The diagnosis codes and revenue codes are in the configuration file under “Quality Metric 04 Readmission.”
 - An outpatient claim that contains one or more diagnosis codes for care after discharge in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* and any revenue code for observation care listed in the input field *Revenue Code*. The diagnosis codes and revenue codes are in the configuration file under “Quality Metric 04 Readmission.”
- The output field *PAP Quality Metric 04 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP where an included claim for care after discharge exists in the post-trigger window, as indicated by the *Quality Metric 04 Indicator*

- Denominator: Number of valid episodes of the PAP

■ **Quality metric 5: Rate of cardiac rehabilitation**

- The *Quality Metric 05 Indicator* marks episodes with a professional or outpatient claim for cardiac rehab in the 90 days following the trigger window. Claims with cardiac rehab are identified by an outpatient or professional claim that is assigned to the 90 days following discharge with a cardiac rehabilitation procedure code in the input field *Detail Procedure Code*. A claim is in the 90 days after the trigger window if the difference between the input field *Detail To Date Of Service* and the *Detail To Date Of Service* of the trigger claim is 90 days or less. The cardiac rehabilitation codes are in the configuration file as “Quality Metric 05 Cardiac Rehabilitation.”
- The output field *PAP Quality Metric 05 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP with at least one cardiac rehabilitation during the 90 days following discharge, as indicated by the *Quality Metric 05 Indicator*
 - Denominator: Number of valid episodes of the PAP

■ **Quality metric 6: Rate of filled Spironolactone and Eplerenone prescriptions**

- The *Quality Metric 06 Indicator* marks episodes with a Spironolactone or Eplerenone prescription during the post-trigger window. Episodes where the patient receives Spironolactone or Eplerenone prescriptions are identified based on a pharmacy claim that has a Spironolactone or Eplerenone medication in the input field *Detail National Drug Code* and is assigned to the post-trigger window.
- The *PAP Quality Metric 06 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP with a Spironolactone or Eplerenone prescription in the post-trigger window, as indicated by the *Quality Metric 06 Indicator*
 - Denominator: Number of valid episodes of the PAP

4.8 Perform risk adjustment

The eighth design dimension of building an acute CHF exacerbation episode is to risk adjust the non-risk-adjusted episode spend for risk factors that may contribute to higher episode spend given the characteristics of a patient.

Episode output fields created: *Risk Factor <risk factor number>, Episode Risk Score, Risk-adjusted Episode Spend*

PAP output fields created: *Average Risk-adjusted PAP Spend, Total Risk-adjusted PAP Spend*

Risk adjustment first requires identification of the risk factors that affect each episode. Then the *Non-risk-adjusted Episode Spend* is multiplied by the risk score that applies to the episode given its risk factors. The derivation of the risk factors and their coefficients is not part of the algorithm to produce an episode and is therefore not described in the DBR.

Flag episodes that are affected by risk factors: The following types of risk factors apply:

- Age-based risk factors: The output fields *Risk Factor <risk factor number>* for age-based risk factors indicate whether the *Member Age* of the patient falls into the age range specified for the risk factor. The relevant age ranges are listed as parameters in the configuration file under “Risk Adjustment” and are inclusive of the minimum (\geq) and maximum (\leq) values. For the definition of *Member Age* see the glossary.
- Diagnosis-based risk factors: The output fields *Risk Factor <risk factor number>* for diagnosis-based risk factors indicate whether an inpatient, outpatient, or professional claim that is assigned to the specified time window contains a risk factor diagnosis code in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The risk factor diagnosis codes and the time windows are listed in the configuration file under “Risk Factor <risk factor number and name> – Diagnoses”.
- CCS category-based risk factors: The output fields *Risk Factor <risk factor number>* for CCS category-based risk factors indicate whether an inpatient, outpatient, or professional claim that is assigned to the specified time window contains a risk factor diagnosis code associated with the CCS code(s) in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. CCS codes are converted into ICD-9 and ICD-10

diagnosis codes using the definition of the single/multi-level CCS categories (as indicated in the configuration file) for ICD-9 and ICD-10 diagnosis codes available from AHRQ ((ICD-9 at <https://www.hcup-us.ahrq.gov/toolssoftware/ccs/ccs.jsp>, ICD-10 at <https://www.hcup-us.ahrq.gov/toolssoftware/ccs10/ccs10.jsp>). The configuration file lists the codes and time windows used under “Risk Factor <risk factor number and name> – CCS”.

- CCS category, Diagnosis, and age-based risk factors: The output fields *Risk Factor <risk factor number>* for CCS category, diagnosis, and age-based risk factors indicate whether both of the following are true:
 - The Member Age of the patient falls into the age range specified for the risk factor. The relevant age ranges are listed as parameters in the configuration file under “Risk Adjustment” and are inclusive of the minimum (\geq) and maximum (\leq) values. For the definition of Member Age see the glossary.
 - There is evidence for the risk factor diagnosis in the specified time window, as identified by either:
 - An inpatient, outpatient, or professional claim that is assigned to the specified time window and contains a risk factor diagnosis code associated with the CCS code(s) in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. CCS codes are converted into ICD-9 and ICD-10 diagnosis codes using the definition of the multi-level CCS categories for ICD-9 and ICD-10 diagnosis codes as described above. The configuration file lists the codes and time windows used under “Risk Factor <risk factor number and name> – CCS”.
 - An inpatient, outpatient, or professional claim that is assigned to the specified time window and contains a risk factor diagnosis code in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The risk factor diagnosis codes and the time windows are listed in the configuration file under “Risk Factor <risk factor number and name> – Diagnoses”.

The claims that are searched for risk factors do not have to be included claims. If a patient was not continuously enrolled during the year before the episode window or during the episode window, risk factors are searched for in the claims available.

Calculate the episode risk score: Each risk factor is associated with a risk coefficient, the values for which are listed as parameters in the configuration file under “Risk Adjustment.” The sum of all the risk coefficients for factors present in a given episode plus the *Average Risk Neutral Episode Spend* is the predicted spend of the episode. The configuration file lists the *Average Risk Neutral Episode Spend* as a parameter under “Risk Adjustment.” For the acute CHF exacerbation episode, the *Episode Risk Score* for an episode is the ratio of the *Average Risk Neutral Episode Spend* to the predicted spend of the episode. For example, if an episode is affected by two risk factors, *Risk Factor 001* and *Risk Factor 002*, the *Episode Risk Score* is:

$$\text{Episode Risk Score} = \frac{\text{Average Risk Neutral Episode Spend}}{\text{Average Risk Neutral Episode Spend} + \text{Risk Coefficient 001} + \text{Risk Coefficient 002}}$$

If an episode is not affected by any risk factors, the *Episode Risk Score* is equal to one (1).

Calculate risk-adjusted episode spend: To calculate the episode output field *Risk-adjusted Episode Spend*, the *Non-risk-adjusted Episode Spend* is multiplied by the *Episode Risk Score*.

$$\text{Risk-adjusted Episode Spend} = \text{Non-risk-adjusted Episode Spend} * \text{Episode Risk Score}$$

The PAP output field *Average Risk-adjusted PAP Spend* is calculated as the average of the *Risk-adjusted Episode Spend* across valid episodes of each PAP. The *Total Risk-adjusted PAP Spend* is calculated as the sum of the *Risk-adjusted Episode Spend* across valid episodes of each PAP.

4.9 Calculate gain/risk sharing amounts

The ninth and final design dimension of building an acute CHF exacerbation episode is to calculate the gain or risk sharing amount for each PAP. The description below outlines one possible approach of linking PAP performance to payments. The State of Ohio may choose to provide further guidance at a future point in time when gain/risk sharing payments will be implemented.

PAP output fields created: *Count Of Total Episodes Per PAP, Count Of Valid Episodes Per PAP, Minimum Episode Volume Pass, Gain Sharing Quality Metric Pass, Gain/Risk Sharing Amount, PAP Sharing Level*

Gain and risk sharing amounts are calculated based on the episodes of each PAP that end during the reporting period. The State's proposed approach to calculating the gain or risk sharing amount paid to/by each PAP uses the following pieces of information:

- **Number of episodes of each PAP:** The output field *Count Of Total Episodes Per PAP* is defined as the number of total episodes each PAP treats during the reporting period. The output field *Count Of Valid Episodes Per PAP* is defined as the number of valid episodes each PAP treats during the reporting period. Episodes are counted separately by each payer. For the provider reports the field *Count Of Valid Episodes Per PAP* is also shown broken out by the number of valid episodes with spend of each claim type (*Count Of Valid Episodes Per PAP With Inpatient/With Outpatient/With Professional/With Pharmacy*). To calculate the breakouts, the number of valid episodes of each PAP are counted that have greater than zero dollars (>\$0) in *Non-risk-adjusted Episode Spend* for a given claim type.
- **Minimum episode requirement:** Only PAPs who pass the minimum episode requirement of five or more (≥ 5) valid episodes receive a provider report and are eligible for gain and risk sharing. The output field *Minimum Episode Volume Pass* is set to indicate whether a PAP has five or more valid episodes during the reporting period. Whether a PAP passes the minimum episode requirement is determined independently by each payer based on the episodes a PAP has for patients enrolled with the payer. The assignment of episodes to a payer is detailed in the glossary under payer attribution.
- **Performance of each PAP on quality metrics tied to gain sharing:** Only PAPs who pass the quality metrics tied to gain sharing are eligible for gain sharing. The thresholds to pass the quality metrics are set in accordance with the definition of each quality metric and are provided as input parameters for the episode algorithm. The output field *Gain Sharing Quality Metric Pass* indicates whether a PAP passes all quality metrics tied to gain sharing.
- **Commendable Threshold, Acceptable Threshold, and Gain Sharing Limit Threshold:** The thresholds are set based on the historical performance of PAPs with five or more episodes. The values for the thresholds are provided as input parameters for the episode algorithm.

- *Gain Share Proportion* and *Risk Share Proportion*: The split of the gains and losses in the episode-based payment model between payer and provider is at the discretion of each payer. The proportions are provided as input parameters for the episode algorithm.

Gain sharing payment: To receive a gain sharing payment, a PAP must meet all of the following three criteria:

- Pass the quality metrics thresholds tied to gain sharing
- Pass the minimum episode requirement,
- Have an *Average Risk-adjusted PAP Spend* below (<) the *Commendable Threshold* and have an *Average Risk-adjusted PAP Spend* above or equal to (>=) the *Gain sharing limit*.

If the three conditions are met, the *Gain/Risk Sharing Amount* is set based on the following formula:

$$\begin{aligned}
 & [\textit{Gain/Risk Sharing Amount}] = \\
 & [\textit{Total Non-risk-adjusted PAP Spend}] \times [\textit{Gain Share Proportion}] \\
 & \times \left(\frac{[\textit{Commendable Threshold}] - [\textit{Average Risk-adjusted PAP Spend}]}{[\textit{Average Risk-adjusted PAP Spend}]} \right)
 \end{aligned}$$

Risk sharing payment: To owe a risk-sharing payment, a PAP must meet both of the following criteria:

- Pass the minimum episode requirement
- Have an *Average Risk-adjusted PAP Spend* above or equal to (>=) the *Acceptable Threshold*.

The risk-sharing payment applies irrespective of the performance of the PAP on the quality metrics. If the above two conditions are met, the *Gain/Risk Sharing Amount* is set based on the following formula:

$$\begin{aligned}
 & [\textit{Gain/Risk Sharing Amount}] = \\
 & [\textit{Total Non-risk-adjusted PAP Spend}] \times [\textit{Risk Share Proportion}] \\
 & \times \left(\frac{[\textit{Acceptable Threshold}] - [\textit{Average Risk-adjusted PAP Spend}]}{[\textit{Average Risk-adjusted PAP Spend}]} \right)
 \end{aligned}$$

If neither the conditions for a gain sharing payment nor a risk sharing payment are met, the output field *Gain/Risk Sharing Amount* is set to zero dollars ('\$0').

To summarize the performance of each PAP in the episode-based payment model the output field *PAP Sharing Level* is set to

- “1” if *Average Risk-adjusted PAP Spend* < *Gain Sharing Limit Threshold*
- “2” if *Average Risk-adjusted PAP Spend* < *Commendable Threshold* and also \geq *Gain Sharing Limit Threshold*
- “3” if *Average Risk-adjusted PAP Spend* \leq *Acceptable Threshold* and also \geq *Commendable Threshold*
- “4” if *Average Risk-adjusted PAP Spend* > *Acceptable Threshold*

*** End of algorithm ***

5. GLOSSARY

- **CHF:** congestive heart failure
- **Claim types:** The claim types used in the CHF episodes are based on the input field *Claim Type*. The required claim types are:
 - Inpatient (I)
 - Outpatient (O)
 - Long-term care (L)
 - Pharmacy (P and Q)
 - Professional (M)

Note that the State of Ohio Department of Medicaid defines long-term care claims based on the input field *Type of Bill* values beginning with 21, 22, 23, 28, 65, and 66.
- **Clean period:** See section 2.3.1
- **CPT:** Current Procedural Terminology
- **DBR:** Detailed Business Requirements
- **Duration of time windows:** The duration of a time window (e.g., the episode window, the trigger window), the duration of a claim or claim detail line, and the length of stay for inpatient stays is calculated as the last date minus the first date plus one (1). For example:
 - A trigger window with a *Trigger Window Start Date* of January 1, 2014 and a *Trigger Window End Date* of January 1, 2014 has a duration of one (1) day.
 - A trigger window with a *Trigger Window Start Date* of January 1, 2014 and a *Trigger Window End Date* of January 3, 2014 has a duration of three (3) days.
 - A claim with a *Header From Date Of Service* of January 1, 2014 and a *Header To Date of Service* of January 2, 2014 has a duration of two (2) days.
- **ED:** Emergency Department
- **E&M:** Evaluation and Management
- **Episode window:** See section 4.2

- **FFS:** Fee For Service
- **HCPCS:** Healthcare Common Procedure Coding System
- **HIC3:** Hierarchical Ingredient Code at the third level based on the classification system by First Databank
- **Hospitalization:** A hospitalization is defined as all the inpatient claims a patient incurs while being continuously hospitalized in one inpatient facility. A hospitalization may include more than one inpatient claim because the inpatient facility may file interim inpatient claims. A hospitalization consisting of just one inpatient claim starts on the *Header From Date Of Service* and ends on the *Discharge Date* of the inpatient claim. A hospitalization where two or more inpatient claims are linked together starts on the *Header From Date Of Service* of the first inpatient claim and ends on the *Discharge Date* of the last inpatient claim in the hospitalization. Within the DBR, the start of a hospitalization is referred to as the *Header From Date Of Service* for that hospitalization and the end of the hospitalization is referred to as the *Discharge Date* of that hospitalization.

Inpatient claims are linked together into one hospitalization consisting of two or more inpatient claims if any of the following conditions apply:

- Interim billing or reserved/missing discharge status: An inpatient claim with a *Patient Status Indicator* that indicates interim billing (see the configuration file under “Hospitalization – Interim Billing” for the codes used), that is reserved (see the configuration file under “Hospitalization – Reserved” for the codes used), or that is missing, is linked with a second inpatient claim into one hospitalization if either of the following conditions apply:
 - There is a second inpatient claim with a *Header From Date Of Service* on the same day as or the day after the *Discharge Date* of the first inpatient claim
 - There is a second inpatient claim with an *Admission Date* on the same day as the *Admit Date* of the first inpatient claim and also a *Header From Date Of Service* on the same day as or within thirty (≤ 30) days after the *Discharge Date* of the first inpatient claim. If the *Discharge Date* of the first inpatient claim is not populated, then use the *Header To Date of Service* of the first inpatient claim.

- If the second inpatient claim (and potentially third, fourth, etc.) also has a *Patient Status Indicator* indicating interim billing, reserved, or missing the hospitalization is extended further until an inpatient claim with a discharge status other than interim billing, reserved, or missing occurs, or until the inpatient claim that follows does not satisfy the required conditions.
 - Transfer: An inpatient claim with a *Patient Status Indicator* indicating a transfer (see the configuration file under “Hospitalization – Transfer” for the codes used) is not linked with the second inpatient claim. The second inpatient claim yields a separate hospitalization with a *Header From Date Of Service* on the same day as or the day after the *Discharge Date* of the first inpatient claim
- **ICD-9:** International Classification of Diseases, Ninth Revision
 - **ICD-10:** International Classification of Diseases, Tenth Revision
 - **ICN:** Internal Control Number
 - **Invalid episodes:** See section 4.6
 - **Length of stay:** See glossary entry Duration of time windows.
 - **MCP:** Managed Care Plan
 - **Member Age:** The output field *Member Age* reflects the patient’s age in years at the episode trigger. *Member Age* is calculated as the difference in years between the start of the claim that is used to set the *Trigger Claim ID* and the date of birth of the patient. The start of the claim is determined using the input field *Header From Date Of Service* for inpatient claims and the earliest *Detail From Date Of Service* across all claim detail lines for outpatient and professional claims. The date of birth of the patient is identified by linking the *Member ID* of the patient in the episode output table to the *Member ID* of the patient in the Member Extract and looking up the date in the input field *Date of Birth*. *Member Age* is always rounded down to the full year. For example, if a patient is 20 years and 11-months old at the start of the episode, the *Member Age* is set to 20 years. If the *Date of Birth* is missing, greater than (>) 100 years, or less than (<) 0 years, then the output field *Member Age* is treated as invalid.
 - **NDC:** National Drug Code
 - **PAP:** Principal Accountable Provider

- **Patient:** An individual with an acute CHF exacerbation episode
- **Payer attribution:** Patients may be enrolled with Ohio Medicaid Fee For Service or with a Managed Care Plan. An episode is assigned to the payer that paid for the claim that is used to set the *Trigger Claim ID*. The payer that paid for a claim is identified using the input data field *MCP ID*.
- **Post-trigger window:** See section 4.2
- **Pre-trigger window:** See section 4.2
- **Total episodes:** All episodes, valid plus invalid.
- **Trigger window:** See section 4.2
- **Valid episodes:** See section 4.6
