1. INTRODUCTION

1.1 Versions and revisions

Episode design is an iterative process that typically involves multiple stakeholders. Once the design is finalized and the episode implemented, experience with the new payment model may generate new insights. The insights can in turn be leveraged to modify and improve the initial episode design. To keep track of the version of an episode used at any given time, a versioning system consisting of three numbers is employed:

- The algorithm version reflects the version of the software code used to produce the outputs for a particular episode. It is indicated by a major and minor version number, e.g., a1.1. The major algorithm version does not reset. The minor algorithm version resets when the major algorithm version is incremented.
- The configuration version reflects the version of the parameter settings and medical codes used to produce the outputs for a particular episode. The configuration includes for example the dollar amounts for the gain/risk sharing thresholds and the trigger diagnoses codes. The configuration version is indicated by a two digit number, e.g., c01. It is specific to the design decisions made by the organization that is implementing an episode and it does not reset.
- The documentation version reflects the version of the Detailed Business Requirements describing a particular episode. It is indicated by a two digit number, e.g., d01, and increments when a revision is made to the documentation without making a change to the algorithm or the configuration. It resets every time the algorithm or the configuration version changes.

Version	Date	Changes
a1.0 c01 d01	11/15/2017	■ Initial design
a1.0 c02 d01	03/14/2018	■ DBR: Added the field 'HIC3 Code' to the input data in section 3.1 and revised section 4 accordingly to indicate that HIC3 codes should be pulled directly from claims rather than being cross-walked from the input field 'National Drug Code'

Version	Date	Changes
		<ul style="list-style-type: none"> ■ DBR: Updated the Source Table Name of the input field 'MCP ID' to specify that the T_CA_ICN.MCO_PROV_KEY should also be used. ■ DBR: Updated section 4.1 to specify that preliminary potential trigger start and end dates can be extended if they overlap with another hospitalization. ■ DBR: Updated section 4.1 to specify that potential triggers cannot be built off of professional claims that overlap with another hospitalization. ■ DBR: Updated section 4.2 to specify that the pre-trigger window can be extended if it overlaps with another hospitalization. ■ DBR: Updated section 4.2 to clarify that overlap between episode windows is not allowed. ■ DBR: Updated section 4.2 to indicate that inpatient potential triggers are given higher priority than outpatient potential triggers. Furthermore, among two or more potential triggers with the same start date and claim type, the potential trigger based on an episode-specific diagnosis is given priority. ■ DBR: Updated section 4.3 language to exclude hospitalizations and long-term care claims from the episode window. ■ DBR: Updated section 4.4 to clarify that a separate methodology is applied to estimate the spend for inpatient, header-paid encounters. ■ DBR: Removed legacy Multiple payer exclusion language from section 4.6 ■ DBR: Updated Glossary to indicate that hospitalization should not be extended to include transfers. ■ DBR: Updated the definition of 'Hospitalization' in the Glossary to indicate that the Header To Date of Service field of the first inpatient claim should be used when its Discharge Date of the claim is not populated ■ Updated the Glossary to expand the definition the Pharmacy claims to include both claim types P and Q. ■ Configuration and DBR: Added the Exempt PAP exclusion in sections 2.3.6, 3.4.1, and 4.6. Added the lists "Business Exclusions - Exempt PAP - Specialty Types" and "Business Exclusions – Exempt PAP – Billing Provider Types”.

Version	Date	Changes
		<ul style="list-style-type: none"> ■ Configuration and DBR: Clarified that the age ranges for risk factors are inclusive of the minimum and value maximum values. ■ Configuration and DBR: Updated all ICD-9 code references to also specify ICD-10.
a1.0 c03 d01	06/12/2018	<ul style="list-style-type: none"> ■ Configuration: Updated the following code lists: 'Comorbidities Cancer - Diagnoses'; 'Comorbidities Cancer Active - Diagnoses'; 'Comorbidities Cancer Active - Procedures'; 'Comorbidities Coma And Brain Damage - Diagnoses'; 'Comorbidities Multiple Sclerosis - Diagnosis' ■ DBR: Updated QM 9 to require the diagnosis to be in the primary position in section 4.7
a1.1 c03 d01	12/30/2019	<ul style="list-style-type: none"> ■ DBR: Updated language in sections 4.9 to reflect the pooled methodology effective for the 2019 program year.

1.2 Scope of this document

The Detailed Business Requirements (DBR) document serves as a guide to understand the definition of an episode. The DBR addresses three audiences:

- The episode owner who is accountable overall for the episode design and implementation
- The analytics team tasked with pressure testing the design of an episode and quality controlling the outputs from the episode algorithm
- The IT team tasked with implementing the algorithm to produce outputs for an episode

Section 2 of the DBR contains a description of the episode and is aimed at the episode owner and the analytics team. It addresses the following questions:

- **Patient journey:** Which patient cases are addressed by the episode?
- **Sources of value:** At which points in the patient journey do providers have most potential to improve quality of care and outcomes?
- **Design dimensions:** What decisions underlie the design of the episode?
 - Trigger: What events trigger an episode?
 - Episode duration: What is the duration of the episode?
 - Claims included and excluded: Which claims are included in or excluded

from the episode spend?

- Episode spend: How is the spend for an episode calculated?
- Principal Accountable Provider (PAP): Which provider is primarily held accountable for the outcomes of an episode?
- Excluded episodes: Which episodes are excluded from a PAP’s average episode spend for the purposes of calculating any gain/risk sharing?
- Quality metrics: Which quality metrics are employed to inform PAPs about their quality of care?
- Risk adjustment: What approach is taken to adjust episodes for risk factors that cannot be directly influenced by the PAP?
- Gain and risk sharing: How are the gain and risk sharing amounts for PAPs determined?

Section 3 of the DBR explains the data flow of an episode. It is aimed at the analytics team and the IT team and addresses the following questions:

- **Input data:** What inputs does the episode algorithm require to build the episode?
- **Episode algorithm:** What is the intent of the episode design that needs to be reflected in the software code to produce the episode outputs?
- **Episode configuration:** What parameters (e.g., dollar amounts) and medical codes (e.g., diagnoses codes) need to be specified to define the episode?
- **Outputs:** What are the outputs of an episode algorithm?
- **Provider reports:** What information is included in the provider reports?

The algorithm logic in section 4 of the DBR is aimed at the IT team. It may also be helpful to the analytics team in their communication with the IT team over the course of quality controlling an episode. The algorithm logic addresses the following questions:

- What are the logical steps the episode algorithm needs to complete in order to produce the required outputs?
- Which cases does the algorithm need to address?
- Are there exceptions to the overall logic and, if so, how are they handled?

The DBR document does not cover the following topics:

- Background on how episodes compare to the current payment system

- Clinical rationale for inclusions and exclusions
- Intermediate analyses used during design of the episode
- Meeting materials used during design of the episode
- Guidance on data collection/transformation/storage
- Guidance on the episode algorithm coding approach

2. DESCRIPTION OF THE EPISODE

2.1 Patient journey

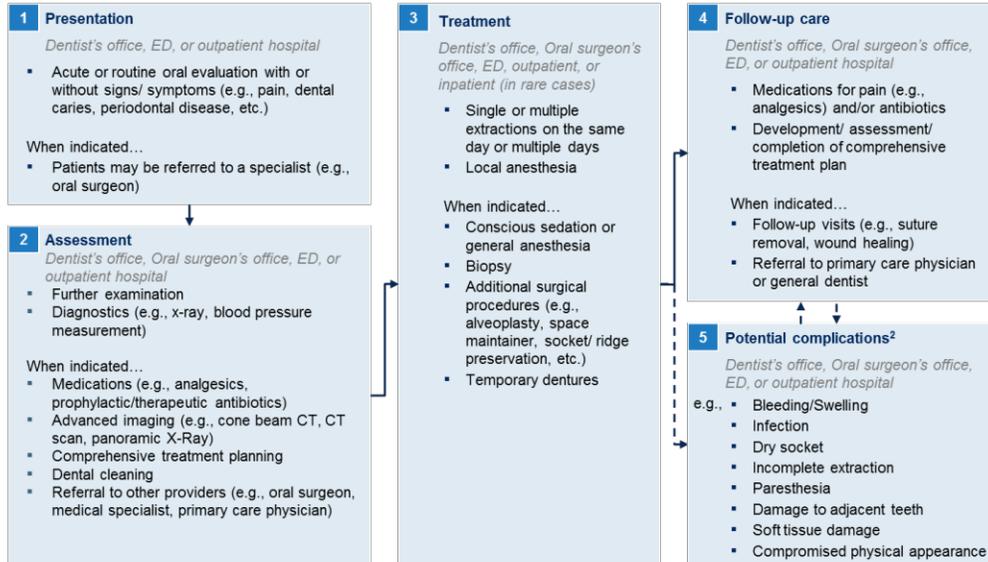

The episode described in this document pertains to patients undergoing a tooth extraction procedure. A configuration file is provided for the tooth extraction episode and providers will receive reports for this episode.

As depicted in Exhibit 1, a tooth extraction episode begins when a patient presents to the office, ED, or an outpatient setting with signs or symptoms of an acute dental condition (e.g., toothache) or for a routine oral evaluation. The patient is assessed by the clinician and may receive further diagnostics, such as dental x-rays, to inform the provider's diagnosis and management. The patient may be prescribed analgesics or antibiotics. In some cases, the patient may also receive advanced imaging (e.g., cone beam CT, panoramic x-ray) or a comprehensive dental treatment plan. The patient may be referred to another specialist such as an oral surgeon for a complex extraction or to a medical provider for an underlying medical condition. If an extraction is deemed necessary, anesthesia may be administered and then a simple extraction, a surgical extraction, or both (either in isolation or in combination) is performed, as per the patient's underlying condition. Additional surgical procedures, such as alveoplasty, insertion of a space maintainer, or socket/ridge preservation, may be performed in conjunction with the tooth extraction. Following the procedure, the patient typically is sent home and may receive post-extraction follow-up care with the clinical team (e.g., suture removal, follow-up to assess wound healing, monitoring for complications). Pain management may also be required, including the prescription of analgesics.

Patients may develop complications during the procedure and/or afterwards. Potential complications include bleeding, infection of the surgical site, dry socket, and incomplete extraction.

EXHIBIT 1 - PATIENT JOURNEY FOR THE TOOTH EXTRACTION EPISODE

Patient journey¹

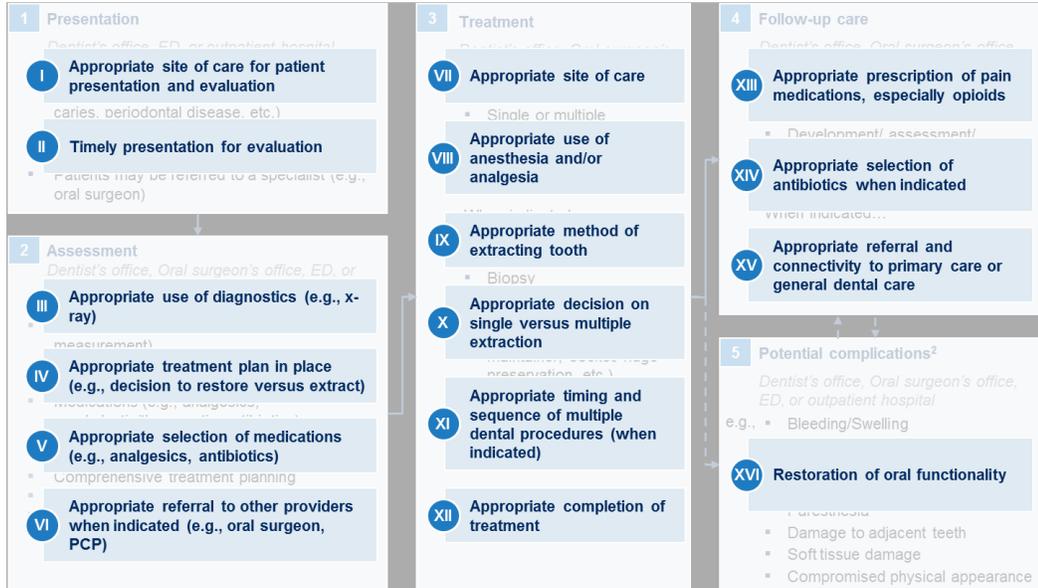

¹ Represents typical patient pathway; individual patient pathways may differ based on the patient's clinical status
² Potential complication list is not exhaustive
 SOURCE: Clinical guidelines; expert interviews

2.2 Sources of value

Within the tooth extraction episode, providers have several opportunities to improve quality of care and reduce unnecessary spend (see Exhibit 2). Important sources of value include the use of appropriate imaging modalities and ensuring the use of an appropriate treatment plan. Additionally, the provider can choose the most appropriate intervention among different types of extraction procedures and single versus multiple extraction. Furthermore, there is an opportunity for the provider to prescribe appropriate pain relief medication and limit the use of opioids. Providers can seek to improve patient education and counseling, which may help patients resolve symptoms, restore oral functionality, and improve oral health. Through appropriate care, providers have the opportunity to reduce the likelihood of avoidable complications and thus decrease costs.

EXHIBIT 2 - SOURCES OF VALUE FOR THE TOOTH EXTRACTION EPISODE

Sources of value

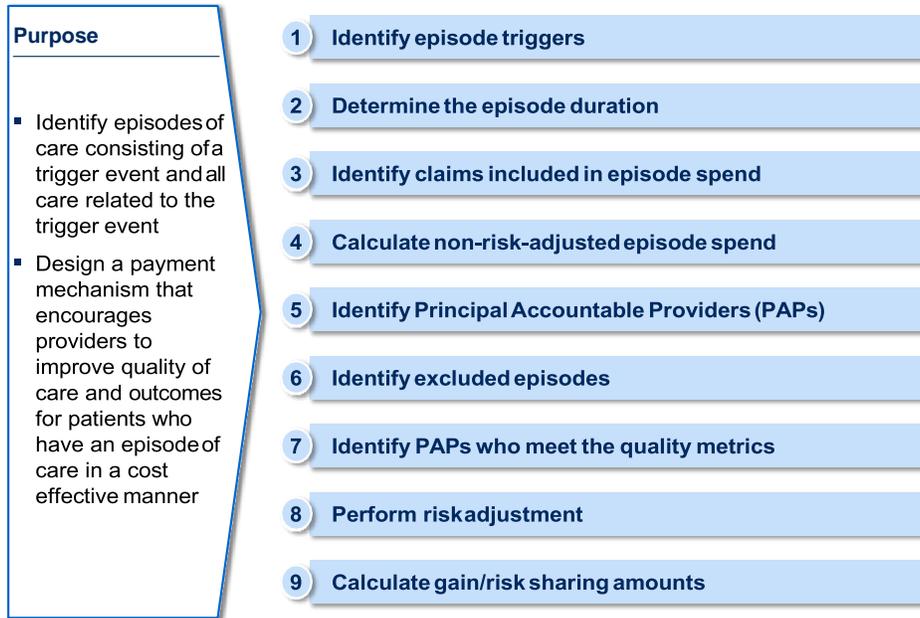

SOURCE: Clinical guidelines; expert interviews

2.3 Design dimensions

Designing and building a tooth extraction episode comprises nine dimensions, as depicted in Exhibit 3. Each dimension is associated with a set of data manipulations that convert the data inputs to the desired data outputs. Section 3 provides additional details on the episode data flow.

EXHIBIT 3 - EPISODE DESIGN DIMENSIONS

2.3.1 Episode trigger

A potential trigger for a tooth extraction episode is identified by a dental, professional, or outpatient claim for a tooth extraction procedure that does not overlap with a hospitalization. The configuration file lists the trigger procedure codes under “Trigger Procedure Codes”. The potential trigger extends for the entire duration of the outpatient visit that triggered the episode. Claim types referenced throughout the DBR are defined in the glossary.

2.3.2 Episode duration

The duration of the tooth extraction episode comprises pre-trigger window 2, pre-trigger window 1, trigger window, post-trigger window 1, and post-trigger window 2. Overall, the duration of the episode is referred to as the episode window.

- **Pre-trigger window 1:** The pre-trigger window 1 begins 30 days prior to the trigger window and ends 1 days prior to the trigger window. If a hospitalization is ongoing on the 1st day of the pre-trigger window 1, the pre-

trigger window 1 is extended to include the first day of the hospitalization. Extending the episode in this way may only occur once per episode window and does not lead to further extensions. Hospitalization is defined in the glossary.

- **Pre-trigger window 2:** The pre-trigger window 2 begins the day before the pre-trigger window 1 starts and ends 60 day prior to the trigger window. If a hospitalization extends the pre-trigger window 1, then the pre-trigger window 2 begins the day before the extended start date of the pre-trigger window 1. Regardless of the duration of the pre-trigger window 1, the pre-trigger window 2 will end 60 days prior to the start date of the trigger window. If a hospitalization extends the pre-trigger window 1 beyond 60 days prior to the start date of the trigger window, the pre-trigger window 2 will have a duration of 0 days. If a hospitalization is ongoing on the 1st day of the pre-trigger window 2, then the pre-trigger window 2 is extended to include the first day of the hospitalization. Extending the episode in this way may only occur once per episode window and does not lead to further extensions. Hospitalization is defined in the glossary.
- **Trigger window:** The trigger window begins on the first day of a potential trigger that constitutes an episode and ends on the last day of a potential trigger that constitutes an episode.
- **Post-trigger window 1:** The post-trigger window 1 begins the day after the trigger window ends and extends for 15 days. If a hospitalization begins on or before the 15th day of the post-trigger window 1 and extends beyond the 15th day (i.e., is ongoing on the 15th day of the post-trigger window 1), then the post-trigger window 1 is extended until discharge from the hospitalization. Extending the episode in this way may only occur once during post-trigger window 1 and a subsequent hospitalization does not lead to further extensions.
- **Post-trigger window 2:** The post-trigger window 2 begins the day after the post-trigger window 1 ends and ends 30 days after the end date of the trigger window. If a hospitalization extends the post-trigger window 1, then the post-trigger window 2 begins the day after the extended end date of the post-trigger window 1. Regardless of the duration of the post-trigger window 1, the post-trigger window 2 will end 30 days after the end date of the trigger window. If a hospitalization extends the post-trigger window 1 beyond 30 days after the end date of the trigger window, the post-trigger window 2 will have a duration of 0 days. If a hospitalization begins on or before the 30th

day of the post-trigger window 2 and extends beyond the 30th day (i.e., is ongoing on the 30th day of the post-trigger windows), then the post-trigger window 2 is extended until discharge from the hospitalization. Extending the episode in this way may only occur once during post-trigger window 2 and a subsequent hospitalization does not lead to further extensions.

- **Clean period:** The clean period starts on the potential trigger start date and extends for 90 days from the potential trigger end date. The clean period is defined as the period during which, if the potential trigger triggers an episode, no new episode of the same type can be triggered. Note that the clean period is not part of the episode duration.

Based on the definitions of the pre-trigger window 2, pre-trigger window 1, trigger window, post-trigger window 1, and post-trigger window 2, potential triggers are divided into trigger procedures and repeat procedures:

- **Trigger procedure:** Potential triggers that do not occur during another episode constitute the trigger window of a new episode.
- **Repeat procedures:** Potential triggers that occur within the clean period of an episode do not constitute the trigger window of a new episode.

2.3.3 Claims included in episode spend

Episode spend is calculated on the basis of claims directly related to or stemming from the tooth extraction episode. Claims that are included in the calculation of episode spend are referred to as included claims. Claims that are not included in the calculation of episode spend are referred to as excluded claims. The criteria to identify included claims depend on the time window during which a claim occurs.

- **Pre-trigger window 2:** Dental claims during the pre-trigger window 2 that are related to the dental examination and imaging are included claims. Included claims during the pre-trigger window 2 fall into the following groups:
 - Dental evaluation and management (E&M) visits: Dental claim detail lines with CDT codes for dental E&M visits are included in the pre-trigger window 2.
 - Included imaging and testing: Dental claim detail lines with CDT procedure codes for specific imaging and testing related to the tooth extraction (e.g., x-ray) are included in the pre-trigger window 2.

- **Pre-trigger window 1:** Outpatient, professional, and dental claims during the pre-trigger window 1 that are related to the tooth extraction procedure are included claims. Included claims during the pre-trigger window 1 fall into the following groups:
 - Dental evaluation and management (E&M) visits: Dental claim detail lines with CDT codes for dental E&M visits are included in the pre-trigger window 1.
 - Related evaluation and management (E&M) visits: Outpatient and professional claim detail lines with CPT codes for specific E&M visits with a primary diagnosis related to a dental disorder are included in the pre-trigger window 1.
 - Included imaging and testing: Outpatient, professional, and dental claim detail lines with CDT/CPT procedure codes for specific imaging and testing related to tooth extraction (e.g., x-ray) are included in the pre-trigger window 1.
 - Included procedures: Outpatient, professional, and dental claim detail lines with CDT procedure codes for specific procedures related to tooth extraction (e.g., dental pain management) are included in the pre-trigger window 1.
 - Included medications: Pharmacy claims with medication codes for specific medications related to the tooth extraction (e.g., analgesics, antibiotics) are included in the pre-trigger window 1.
 - Excluded evaluation and management visits: Outpatient, professional, and dental claims with specific E&M visits related to emergency department or urgent care center are excluded from the pre-trigger window 1.
- **Trigger window:** All dental claims during the trigger window are included. Outpatient, professional, and pharmacy claims during the trigger window that are related to the tooth extraction procedure are included claims. Included claims during the trigger window fall into the following groups:
 - Dental claims: All dental claims are included in the trigger window.
 - Included diagnoses: Outpatient, dental, and professional claims with ICD-9 or ICD-10 diagnosis codes for specific care related to tooth extraction (e.g., toothache) are included in the trigger window.

- Included imaging and testing: Outpatient and professional claim detail lines with CPT/HCPCS procedure codes for specific imaging and testing related to the tooth extraction (e.g., CT scan) are included in the trigger window.
- Included procedures: Outpatient and professional claim detail lines with CDT/CPT/HCPCS procedure codes for specific procedures related to the tooth extraction are included in the trigger window.
- Included medications: Pharmacy claims with medication codes for specific medications related to the tooth extraction (e.g., analgesics) and treatment for complications related to the tooth extraction are included in the trigger window.
- Excluded dental procedures: Dental claim detail lines with CDT procedure codes that are unrelated to tooth extraction (e.g., fillings, sealant) are excluded from the trigger window.
- **Post-trigger window 1:** Outpatient, dental, professional, and pharmacy claims during the post-trigger window 1 that are related to the tooth extraction procedure, or indicate potential complications, are included claims. Included claims during the post-trigger window 1 fall into the following groups:
 - Dental evaluation and management visits: Dental claim detail lines with CDT codes for dental E&M visits are included in the post-trigger window 1.
 - Included diagnoses: Outpatient, professional, and dental claims with ICD-9 or ICD-10 diagnosis codes for specific diagnoses related to the tooth extraction (e.g., tooth ache, abscess) are included in post-trigger window 1.
 - Included imaging and testing: Outpatient, dental, and professional claim detail lines with CPT/CDT procedure codes for specific imaging and testing related to the tooth extraction (e.g., CT scan) are included in post-trigger window 1.
 - Included procedures: Outpatient, dental, and professional claim detail lines with CPT/CDT/HCPCS procedure codes for specific procedures related to the tooth extraction (e.g., incision and drainage) are included in post-trigger window 1.

- Included medications: Pharmacy claims with medication codes for specific medications related to the tooth extraction (e.g., analgesics) and treatment for complications related to the tooth extraction are included in post-trigger window 1.
- **Post-trigger window 2:** Pharmacy claims during the post-trigger window 2 that are related to the tooth extraction procedure are included claims. Included claims during the post-trigger window 2 fall into the following group:
 - Included medications: Pharmacy claims with medication codes for opioid medications are included in post-trigger window 2.

The one exception to the above logic are claims related to transportation and vaccines, which are always excluded claims when the procedures occur on outpatient, professional, or dental claims.

The codes used to identify included diagnoses, included procedures, included imaging and testing, included medications, excluded procedures, excluded ED, observation care, and urgent care visits, excluded transportation, and excluded vaccinations are listed in the configuration file under “Included Diagnoses”, “Included Relevant Diagnoses”, “Included Procedures - Pre-trigger 1”, “Included Procedures - Trigger and Post-trigger 1”, “Included E&M Visits”, “Included Dental E&M Visits”, “Included Imaging and Testing - Pre-trigger 2”, “Included Imaging and Testing - Pre-trigger 1”, “Included Imaging and Testing - Trigger and Post-trigger 1”, “Included Medications - Pre-trigger 1”, “Included Medications - Trigger”, “Included Medications - Post-trigger 1”, “Included Medications - Post-trigger 2”, “Excluded Procedures”, “Excluded ED Observation Room and Urgent Care Center Facility Visits”, “Excluded Transportation Procedures”, and “Excluded Vaccine Administrations”, respectively.

2.3.4 Episode spend

The episode spend is the amount that reflects the totality of spend for included claims. Since the totality of spend for included claims is not risk-adjusted, it is referred to as non-risk-adjusted episode spend. Based on the available data, Ohio Medicaid calculates the non-risk-adjusted episode spend as the sum of the allowed amount for included claims from Medicaid Fee For Service (FFS) and the sum of the paid amount for included claims from Medicaid Managed Care Plans (MCPs). Given variation in data and payment

practices, payers should use their judgment in determining which fields to utilize so as to best reflect the entire spend of an episode.

To remove variation in inpatient spend that is intentionally not addressed by the episode-based payment model, spend for included, DRG-paid inpatient claims is calculated by summing the APR-DRG base payment and the APR-DRG outlier payment for each included, DRG-paid inpatient claim. Medical education and capital expenditure payments are not included in non-risk-adjusted episode spend.

The non-risk-adjusted episode spend is calculated overall and by claim type, by window during the episode, and by claim type and window during the episode.

For the purpose of risk-adjustment only, a separate measure of episode spend, referred to as normalized-non-risk-adjusted episode spend, is used. Normalized-non-risk-adjusted episode spend is calculated using normalized APR-DRG base rates for DRG-paid inpatient claims to remove variation in unit prices before performing risk adjustment. DRG-exempt inpatient, outpatient, professional, dental, and pharmacy spend is calculated the same way for normalized-non-risk-adjusted episode spend as for non-risk-adjusted episode spend.

To calculate the DRG-paid inpatient spend component of normalized-non-risk-adjusted episode spend the APR-DRG base payment for each included DRG-paid inpatient claim is normalized using the following method: The normalized base rate is calculated as the average hospital base rate across all DRG-paid inpatient claims weighted by volume of DRG-paid inpatient claims. The DRG base payment on each DRG-paid inpatient claim is then multiplied by the ratio of the normalized base rate to the actual base rate of each hospital. Outlier payments, if present, are added unchanged. The medical education payment and the capital expenditure payment are not included in normalized-non-risk-adjusted episode spend.

2.3.5 Principal Accountable Provider

The Principal Accountable Provider (PAP) is the provider deemed to be in the best position to influence the quality and cost of care for the tooth extraction episode. The PAP is the clinician performing the procedure. The PAP is identified using the billing provider ID on the dental, professional, or outpatient claim that triggered the episode.

2.3.6 Excluded episodes

Episode exclusions ensure that the remaining episodes are comparable to each other and allow fair comparisons between patient panels. After all exclusions that identify invalid episodes have been applied, a set of valid episodes remains. The valid episodes form the basis to assess the performance of PAPs.

■ **Business exclusions:**

- Dual eligibility: An episode is excluded if a patient has dual coverage by Medicaid and Medicare at any time during the episode window. The configuration file lists the codes used to identify dual eligible beneficiaries under “Business Exclusions - Duals”.
- FQHC/RHC: An episode is excluded if the PAP is classified as a federally qualified health center or rural health clinic. The configuration file lists the codes used to identify FQHCs and RHCs under “Business Exclusions - FQHC And RHC”.
- Incomplete episodes: An episode is excluded if the non-risk-adjusted episode spend (not the risk-adjusted episode spend) is less than the incomplete episode threshold. Spend less than the incomplete episode threshold may be an indication that claims are miscoded or incomplete. The incomplete episode threshold was set at the cost of the minimum services required to treat an episode. The incomplete episode threshold is listed as a parameter in the configuration file under “Excluded Episodes”.
- Inconsistent enrollment: An episode is excluded if there are gaps in full Medicaid coverage (FFS or with an MCP) of the patient during the episode window. The configuration file lists the codes used to identify beneficiaries with inconsistent enrollment under “Business Exclusions - Inconsistent Enrollment”.
- Long hospitalization: An episode is excluded if a hospitalization longer than (>) 30 days occurs during the episode window.
- Long-term care: An episode is excluded if long-term care occurs during the episode window.

- Missing APR-DRG: An episode is excluded if a DRG-paid inpatient claim during the episode window is missing the APR-DRG and severity of illness.
- Multiple payers: An episode is excluded if a patient changes enrollment between MCPs during the trigger window or the post-trigger window(s) (if applicable). The rules to attribute an episode to a payer are described in the glossary under “Payer Attribution”.
- No PAP: An episode is excluded if the billing provider number is not available.
- PAP out of state: An episode is excluded if the PAP’s practice address is outside Ohio.
- Third-party liability: An episode is excluded if third-party liability charges are present on any claim or claim detail line during the episode window or if the patient has relevant third-party coverage at any time during the episode window.

■ **Clinical exclusions:**

- Age: A tooth extraction episode is excluded if the patient is older than sixty-four (>64) years of age.
- Comorbidity: An episode is excluded if the patient has one or more of the following comorbidities during a specified time window. The configuration file lists the comorbidity codes and time windows under “Comorbidities <Comorbidity Name> - <Procedures or Diagnosis>”. Comorbidity codes are searched for on inpatient, outpatient, dental, and professional claims.

The comorbidity exclusions are:

- Cancer under active management during the episode window or during the 90 days before the episode window
- Coma or brain damage during the episode window or during the 365 days before the episode window
- Cystic fibrosis during the episode window or during the 365 days before the episode window
- End stage renal disease (ESRD) during the episode window or during the 365 days before the episode window

- HIV during the episode window or during the 365 days before the episode window
- Multiple Sclerosis during the episode window or during the 365 days before the episode window
- Organ transplant during the episode window or during the 365 days before the episode window
- Paralysis during the episode window or during the 365 days before the episode window
- Tuberculosis during the episode window
- Death: An episode is excluded if the patient has a discharge status of “expired” on any inpatient or outpatient claim during the episode window or has a date of death before the end of the episode window.
- Dental extraction CPT: An episode is excluded if the patient has a CPT code for dental extraction on the trigger claim and no CDT code for dental extraction in the trigger window. The configuration file lists the CPT and CDT codes for tooth extraction under “Dental Procedure CPT - Procedures” and “Dental Procedure CDT - Procedures” respectively.
- Left against medical advice: An episode is excluded if a patient has a discharge status of “left against medical advice or discontinued care” on any inpatient or outpatient claim during the episode window.
- Multiple other comorbidities: A tooth extraction episode is excluded if it is affected by too many risk factors to reliably risk adjust the episode spend. The configuration file lists the number of risk factors beyond which an episode is excluded as a parameter under “Excluded Episodes”.

■ **Outliers:**

- High outlier: An episode is excluded if the risk-adjusted episode spend (not the non-risk-adjusted episode spend) is greater than the high outlier threshold. The high outlier threshold was set based on analyses of episode spend distributions for episodes that ended between the beginning of October 2014 and the end of September 2015 inclusive. It was set at three standard deviations above the average risk-adjusted episode spend for otherwise valid episodes. The high outlier threshold is listed as a parameter in the configuration file under “High Outlier”.

2.3.7 Quality metrics

A PAP must pass all quality metrics tied to gain sharing to be eligible for gain sharing. PAPs also receive information on additional quality metrics that allow them to assess their performance, but do not affect their eligibility to participate in gain sharing. Quality metrics are calculated for each individual PAP across valid episodes attributed to the PAP. The quality metrics are based on information contained in the claims filed for each patient. Additional information on how the quality metrics could be tied to gain sharing is provided in section 2.3.9 (“Gain and risk sharing”).

■ **Quality metrics tied to gain sharing for the tooth extraction episode:**

- Quality metric 1: Average difference in morphine equivalent dose (MED)/day between the post-trigger opioid window (0 - 30 days after the trigger start) and the pre-trigger opioid window (1 - 30 days prior to the trigger start), across valid episodes with at least one opioid prescription during the episode window. The opioid windows are defined in detail in Section 4.7. The codes used to identify opioids are included in the CDC Oral Morphine Milligram Equivalents file.
- Quality metric 2: Percentage of valid episodes with an included ED visit during the post-trigger window 1. Codes used to identify ED and observation care revenue and ED and observation care procedure codes are listed in the configuration file under “Quality Metric 02 & 09 ED Visit Or Observation Care - Revenue Codes” and “Quality Metric 02 & 09 ED Visit Or Observation Care - Procedure Codes” respectively.

■ **Quality metrics not tied to gain sharing (i.e., included for information only) for the tooth extraction episode:**

- Quality metric 3: Average MED/day during the 1-30 days before the trigger start. The codes used to identify opioids are included in the CDC Oral Morphine Milligram Equivalents file.
- Quality metric 4: Average MED/day during the 0-30 days after the trigger start. The codes used to identify opioids are included in the CDC Oral Morphine Milligram Equivalents file.
- Quality metric 5: Percent of episodes with a filled opioid prescription during the trigger, post-trigger window 1, or post-trigger window 2 among patients that did not have a filled opioid prescription during the 90 days

before the trigger window. The codes used to identify opioids are listed in the configuration file under “Quality Metric 05 Opioids”.

- Quality metric 6: Percent of valid episodes for which there are 30 days or less between the first dental visit to any provider and the triggering tooth extraction procedure, and the absence of a dental visit in the 31 to 90 days prior to the triggering extraction procedures. The codes used to identify dental visits are in the configuration file under “Quality Metric 06 Dental E&M Visits”.
- Quality metric 7: Percent of valid episodes with the presence of at least one preventive service provided in the 365 days prior to the episode start. The codes used to identify preventive services are in the configuration file under “Quality Metric 07 Preventive Services”.
- Quality metric 8: Percent of valid episodes for patients under 5 years of age who received general anesthesia during the trigger window. The codes used to identify general anesthesia are in the configuration file under “Quality Metric 08 General Anesthesia”.
- Quality metric 9: Percent of valid episodes with a related emergency department visit in the pre-trigger window 2 or pre-trigger window 1 who received dental care from the principal accountable provider in the 365 days prior to the episode start. Codes used to identify ED and observation care revenue and ED and observation care procedure codes are listed in the configuration file under “Quality Metric 02 & 09 ED Visit Or Observation Care - Revenue Codes” and “Quality Metric 02 & 09 ED Visit Or Observation Care - Procedure Codes”. Codes used to determine dental care are listed in the configuration file under “Quality Metric 09 Dental Procedures”.

2.3.8 Risk adjustment

Principal Accountable Providers (PAPs) participating in episode-based payment models are compared based on their performance on quality metrics and based on the average spend for episodes treated by each PAP. The credibility and effectiveness of an episode-based payment model therefore rests on the comparability and fairness of the episode spend measure used in the comparisons. Risk adjustment is one of several mechanisms that episode-based payment models may use to achieve comparability in episode spend across PAPs.

Risk adjustment specifically captures the impact on episode spend of documented clinical risk factors that typically require additional care during an episode and are outside the control of the PAP. The goal of risk adjustment is to account for different levels of medical risk across patient panels and, by doing so, reduce incentives for tactical selection of patients (i.e., avoiding riskier and more costly patients) when payments are tied to episode spend performance.

Risk factors and risk coefficients are identified in an iterative process informed by medical best practice, expert opinion, and statistical testing. The risk coefficients are used to calculate a risk score for each episode given the risk factors that are present for the episode. The risk score represents the ratio of the expected episode spend when no risk factors are present to the expected episode spend given the set of risk factors present for the episode. Multiplying the observed episode spend by the risk score results in the risk-adjusted episode spend. Risk-adjusted episode spend represents how much spend would have been incurred during the episode window had there been no risk factors present, all other things being equal. By minimizing the effect of clinically documented medical risk that is outside the control of the PAP on episode spend, risk-adjustment contributes to the fairness of the episode spend comparisons that underlie episode-based payment models.

For additional details on the risk adjustment process, please refer to the document “Supporting documentation on episode risk adjustment.”

This process was conducted as part of episode design by the Ohio Department of Medicaid. Risk factors and coefficients derived from this process are included in the accompanying configuration file. At this time it is not expected that individual payers run their own risk adjustment process for the Ohio Medicaid population.

- Risk factors for the tooth extraction episode:
 - Ages 00 to 05
 - Ages 13 to 17
 - Ages 18 to 25
 - Anemia
 - Anxiety disorders
 - Benign neoplasms of the head, face, and neck
 - Chromosomal anomalies

- Chronic sinusitis
- COPD
- Developmental disorders
- Diseases of mouth excluding dental
- Epilepsy
- Heart valve disorders
- History of craniofacial trauma
- Hypertension
- Lower dentures
- Multiple extraction range 02 to 05
- Multiple extraction range 06 to 10
- Multiple extraction range 11 to 20
- Multiple extraction range 21 or more
- Non-thromboembolic arterial disorders
- Non-wisdom teeth removal completely bony
- Non-wisdom teeth removal completely bony with complications
- Non-wisdom teeth removal partially bony
- Non-wisdom teeth removal, residual roots
- Other nervous system disorders
- Other structural congenital anomalies
- Partial dentures
- Pathological fractures
- Previous endodontic procedures
- Previous extraction procedures
- Previous restorative procedures
- Recent crushing or internal injury
- Rheumatoid arthritis
- Thromboembolic disorders

- Wisdom teeth removal completely bony
- Wisdom teeth removal completely bony with complications
- Wisdom teeth removal partial bony
- Wisdom teeth removal residual roots
- Wisdom teeth removal soft tissue

Except for the age ranges, the time period during which risk factors must be present can be found in the configuration file under the column “Time Period”. Member Age is defined in the glossary. The risk coefficients associated with each risk factor are listed as parameters in the configuration file under “Risk Adjustment”.

2.3.9 Gain and risk sharing

The State of Ohio and the MCPs will send provider reports to PAPs to inform them about their performance in the episode-based payment model. A detailed description of the provider reports is beyond the scope of the Detailed Business Requirements. Please refer to the “Episode of Care Payment Report Sample” provided separately as a general guide for the layout and metrics of the provider reports.

At some point after thresholds are set, provider reports will include gain/risk sharing information. Gain/risk sharing is determined based on the comparison of the average risk-adjusted episode spend for valid episodes of each PAP to three pre-determined thresholds. The thresholds and relevant calculations are detailed below. Note that, throughout this section, the average risk-adjusted episode spend for valid episodes will be referred to as the ‘average risk-adjusted spend’:

- **Acceptable threshold:** PAPs with an average risk-adjusted spend above the acceptable threshold and that also have a minimum of five valid episodes during the performance period owe a risk-sharing payment.
- **Commendable threshold:** PAPs with an average risk-adjusted spend between the commendable threshold and above the gain sharing limit threshold that also have a minimum of five valid episodes and pass the quality metrics tied to gain sharing during the performance period receive a gain sharing payment.
- **Gain sharing limit threshold:** PAPs with average risk-adjusted spend below the gain sharing limit threshold that also have a minimum of five valid

episodes and pass the quality measures tied to gain sharing receive a gain sharing payment that is proportional to the difference between the commendable threshold and the gain sharing limit as a percentage of average risk-adjusted episode spend.

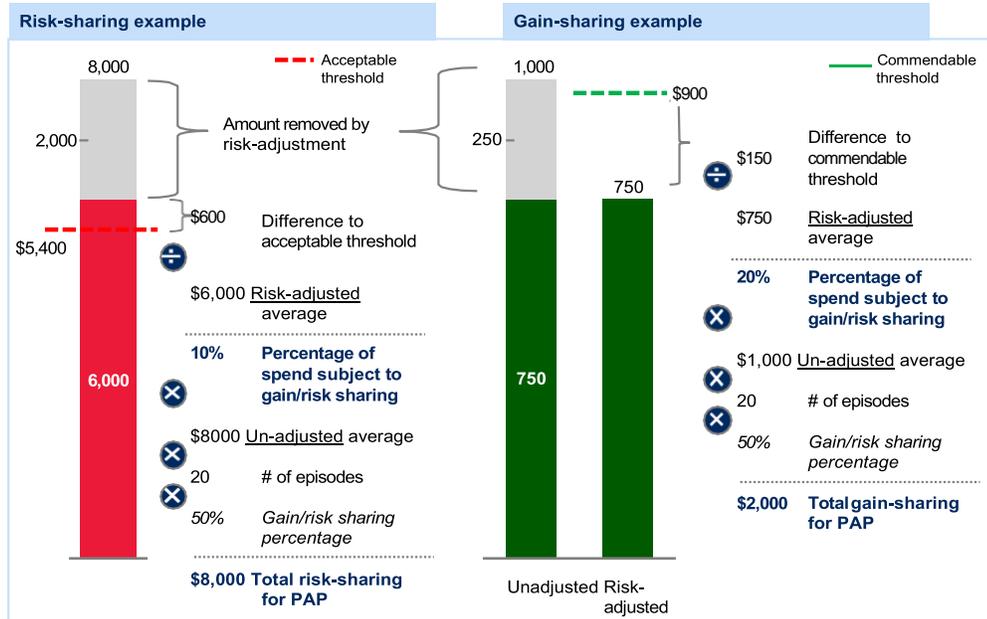

PAPs with average risk-adjusted episode spend between the acceptable and commendable thresholds may neither owe a risk sharing payment nor receive a gain sharing payment.

The gain or risk sharing payment of each PAP is calculated based on episodes that ended during a performance period of a certain length (e.g., 12 months). The calculation of the gain or risk sharing payment is as follows (Exhibit 4):

- **Risk sharing:** The calculation of the risk-sharing amount involves multiplying the percentage of spend subject to risk-sharing by the total non-risk-adjusted episode spend for all valid episodes of the PAP and the risk-sharing proportion (e.g., 50%). The percentage of spend subject to risk-sharing is the difference between the PAP's risk-adjusted spend and the acceptable threshold as a percentage of the PAP's risk-adjusted spend.
- **Gain sharing:** The calculation of the gain-sharing amount involves multiplying the percentage of spend subject to gain sharing by both a PAP's total non-risk-adjusted episode spend for valid episodes and the gain-sharing proportion (e.g., 50%). The calculation of the percentage of spend subject to gain sharing depends on whether the PAP's average risk-adjusted spend is above or below the gain-sharing limit:
 - If a PAP's average risk-adjusted spend is above the gain sharing limit, the percentage of spend subject to gain-sharing is the difference between the PAP's average risk-adjusted spend and the commendable threshold as a percentage of the PAP's average risk-adjusted spend. If the PAP's average risk-adjusted spend is below the gain sharing limit, the percentage of spend subject to gain sharing is the difference between the gain sharing limit and the commendable threshold as a percentage of the PAP's average risk-adjusted spend.

EXHIBIT 4 - CALCULATION OF RISK- AND GAIN-SHARING PAYMENTS

ILLUSTRATIVE EXAMPLE

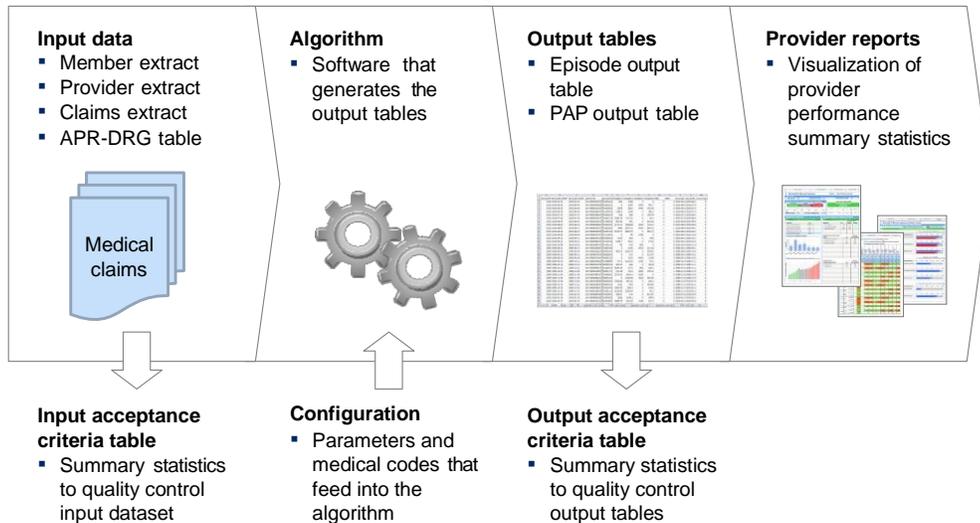

3. EPISODE DATA FLOW

The analytics underlying an episode-based payment model are performed by an episode algorithm. The algorithm takes an input dataset, transforms the data in accordance with the intent of the episode design, and produces a set of output tables (Exhibit 5). The output tables are used to create provider reports.

Several of the episode design dimensions require input parameters such as age ranges and medical codes such as diagnosis, procedure, and medication codes to specify the intent of the episode. The parameters and medical codes are provided in the episode configuration.

It is recommended that the episode data flow include two elements for quality assurance: (1) An input acceptance criteria table to assess the content and quality of the input dataset. (2) An output acceptance criteria table to assess the content and quality of the output tables. It is the responsibility of each payer to determine the details of appropriate quality assurance measures.

EXHIBIT 5 - EPISODE DATA FLOW

3.1 Input data

To build an episode, the following input data are needed:

- **Member Extract:** List of patients and their health insurance enrollment information.
- **Provider Extract:** List of participating providers and their addresses.
- **Claims Extract:** Institutional claims (UB-04 claim form), professional claims (CMS1500 claim form), dental claims (ADA claim form), and pharmacy claims (NCPDP claim form) at the patient level.
- **APR-DRG Base Rate Table:** Table containing the APR-DRG base rate for each DRG-paid provider.
- **CDC Oral Morphine Milligram Equivalents File:** Tables containing factors for converting drugs to morphine milligram equivalents.

The table below lists the required input fields using the source field abbreviations and source table names provided in the Ohio Vendor Extracts Companion Guides. The algorithm logic (section 4) describes the use of each

input field. In the algorithm logic, input fields are referred to by the “Source field name in DBR” and written in italics.

The date range for the input data has to include the 12 months duration reporting period as well as the 13 months preceding the reporting period. The time period preceding the reporting period is set at 13 months as it is comprised of the duration of the post-trigger window as well as 12 months prior to the episode trigger. This time period is needed to allow for identification of risk factors and comorbidities as well as to provide sufficient input data to identify the episode start date for the first episodes that end during the reporting period.

The input data includes claims from the payer responsible for the episode as well as historical claims from other Medicaid payers prior to the episode trigger. Payers are provided with this claims data upon member enrollment. The inclusion of this data is particularly important in generating appropriate risk factors and exclusions.

Historical data should be treated exactly the same as claims that were submitted directly to the payer with one exception: Payers should only report on episodes

for which they paid the triggering claim in order to avoid double-counting of episodes across plans.

The input data has to contain only unique and paid claims. It is the responsibility of each payer to apply appropriate methods to ensure that all claims in the input data are valid, de-duplicated, and paid. For Ohio Medicaid, the methods provided by the State are used to remove duplicate and void claims. The input fields *Header Paid Status* and *Detail Paid Status* are used to determine whether a claim or claim detail line was paid.

If the value of an input field from the Claims Extract that is required to build an episode is missing or invalid, then the corresponding claim is ignored when building the episode. For example, a claim that would be a potential trigger, but is missing the *Header From Date Of Service*, cannot be a potential trigger.

The CDC Oral Morphine Milligram Equivalents Table is a publicly available dataset that is maintained and updated by the CDC.¹ Since this dataset changes over time, an updated dataset must be used for each reporting period. The data are used for certain opioid quality metrics. A subset of the data are used in the calculation of these quality metrics. First, all tabs of the file are combined. Second, the rows are filtered such that the only rows remaining are those that meet all of the following conditions:

- The input field *Drug Class* is equal to “Opioid”;
- The input field *Conversion Factor* is not blank; and
- The input field *Generic Name* is not equal to one of the excluded opioids. The configuration file lists excluded opioid names under “Excluded Opioids”.

¹ National Center for Injury Prevention and Control. CDC compilation of benzodiazepines, muscle relaxants, stimulants, zolpidem, and opioid analgesics with oral morphine milligram equivalent conversion factors, 2017 version. Atlanta, GA: Centers for Disease Control and Prevention; 2017. Available at <https://www.cdc.gov/drugoverdose/resources/data.html> (accessed November 16, 2017).

3.2 Episode algorithm

The intent of the episode algorithm is detailed in the algorithm logic (section 4) of the DBR.

3.3 Episode configuration

The parameters and medical codes needed to define an episode are listed in the configuration file which is provided as an attachment to the DBR. The file includes:

- **Parameters sheet:** Values for parameters used in the episode, for example the outlier thresholds and risk coefficients.
- **Code sheet:** Medical codes used in the episode, for example trigger diagnosis or procedure codes and codes to identify included claims. Diagnosis and procedure codes may be provided as complete or incomplete codes. If an incomplete code is provided, the incomplete code itself as well as all complete codes that stem from it need to be taken into account when using the code.

The algorithm logic (section 4) explains the intended use of the parameters and medical codes by the episode algorithm. References to medical codes in the configuration file are made using the name for the relevant design dimension subcategory in the code sheet of the configuration file. References to parameters in the configuration file are made using the name for the relevant design dimension in the parameters sheet of the configuration file.

3.4 Output tables

Using the input data tables and the configuration file, an episode algorithm creates two output tables: the episode output table and the PAP output table. The algorithm logic (section 4) describes the definition of each output field. In the algorithm logic, output fields are referred to by the output field names provided in the tables below and are written in italics.

3.4.1 Episode output table

The episode output table contains the set of episodes identified by the algorithm and the characteristics of each episode. The table below lists the required output fields.

Table - Episode Output Table

Output field name	Output field abbreviation

3.5 Provider reports

During the initial implementation phase, each PAP receives a report to inform them about their performance in the episode-based payment model. The information shown in the provider report is based on the episode and PAP output tables. The reports show episodes with an episode end date during the reporting period. A detailed description of the provider report is beyond the scope of the Detailed Business Requirements. Please refer to the “Episode of Care Payment

Report Sample” provided separately as a general guide for the layout and metrics of the provider report.

4. ALGORITHM LOGIC

The algorithm logic forms the basis to code an episode algorithm. It explains the intent of the episode design at a level of granularity that will allow an IT implementation team to create an algorithm that matches the episode design.

4.1 Identify episode triggers

The first design dimension of building a tooth extraction episode is to identify potential triggers.

Episode output fields created: *Trigger Claim ID, Member ID*

Potential triggers are identified over the entire date range of the input data. For the tooth extraction episode, a potential trigger is defined as a dental, professional, or outpatient claim with a relevant tooth extraction procedure code that does not overlap with a hospitalization. Claim types (inpatient, outpatient, professional, dental, and pharmacy) are identified based on the input field *Claim Type*. For the definition of claim type see the glossary.

The dental, professional, or outpatient claim for the potential trigger must meet both of the following conditions:

- The claim has a procedure code for tooth extraction in the input field *Detail Procedure Code* on one or more of its claim detail lines. The configuration file lists the procedure codes under “Trigger Procedure Codes”.
- The triggering claim detail line does not overlap with a hospitalization. The definition of hospitalization can be found in the glossary.

A hospitalization overlaps with the triggering claim detail line if it meets both of the following conditions:

- The *Header From Date Of Service* on the first inpatient claim of a hospitalization is on or before (\leq) the input field *Detail To Date Of Service* of the triggering claim detail line(s).

- The *Discharge Date* of the last inpatient claim of a hospitalization is on or after (\geq) the input field *Detail To Date Of Service* of the triggering claim detail line(s).

Potential triggers start on the input field *Detail From Date Of Service* and end on the input field *Detail To Date Of Service* of the triggering dental, professional, or outpatient claim detail line with one of the procedure codes listed under “Trigger Procedure Codes”.

The output field *Trigger Claim ID* is set to the input field *Internal Control Number* of the dental, professional, or outpatient claim that identifies a potential trigger. The output field *Member ID* is set to the input field *Member ID* of the dental, professional, or outpatient claim that identifies a potential trigger.

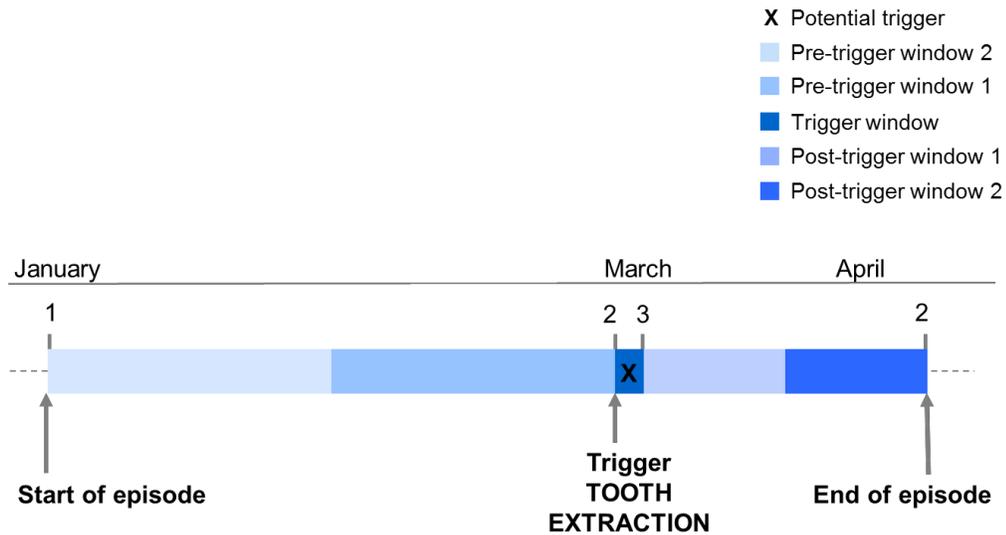

4.2 Determine the episode duration

The second design dimension of building a tooth extraction episode is to define the duration of the episode and to assign claims and claim detail lines to each episode.

Episode output fields created: *Pre-Trigger Window 2 Start Date, Pre-trigger Window 2 End Date, Pre-Trigger Window 1 Start Date, Pre-trigger Window 1 End Date, Trigger Window Start Date, Trigger Window End Date, Post-trigger Window 1 Start Date, Post-trigger Window 1 End Date, Post-trigger Window 2 Start Date, Post-trigger Window 2 End Date, Episode Start Date, Episode End Date*

Five time windows are of relevance in determining the episode duration (see Exhibit 6).

EXHIBIT 6 - TOOTH EXTRACTION EPISODE DURATION

- **Pre-trigger window 1:** The output field *Pre-trigger Window 1 Start Date* is set to 30 days before the *Trigger Window Start Date*. The *Pre-trigger Window 1 End Date* is set to the day before the *Trigger Window Start Date*. If a hospitalization is ongoing on the 1st day of the pre-trigger window 1, the *Pre-Trigger Window 1 Start Date* is set to the *Header From Date Of Service* of the hospitalization. A hospitalization is ongoing on the 1st day of the pre-trigger window 1 if the hospitalization has a *Header From Date Of Service* before the existing pre-trigger window 1 and a *Discharge Date* during the pre-trigger window 1. If more than one hospitalization is ongoing on the 1st day of the pre-trigger window 1, the earliest *Header From Date of Service* sets the start date of the pre-trigger window 1. Hospitalizations are defined in the glossary.
- **Pre-trigger window 2:** The output field *Pre-trigger Window 2 Start Date* is set to 60 days before the *Trigger Window Start Date*. The *Pre-trigger Window 2 End Date* is set to the day before the *Pre-trigger Window 1 Start Date*. The output field *Pre-trigger Window 2 Start Date* is also the *Episode Start Date*. If a hospitalization extends the pre-trigger window 1 beyond 60 days prior to the output field *Trigger Window Start Date*, the pre-trigger window 2 will have a duration of 0 days. If a hospitalization is ongoing on the 1st day of the pre-trigger window 2, the *Pre-Trigger Window 2 Start Date*

is set to the *Header From Date Of Service* of the hospitalization. A hospitalization is ongoing on the 1st day of the pre-trigger window 2 if the hospitalization has a *Header From Date Of Service* before the existing pre-trigger window 2 and a *Discharge Date* during the pre-trigger window 2. If more than one hospitalization is ongoing on the 1st day of the pre-trigger window 2, the earliest *Header From Date of Service* sets the start date of the pre-trigger window 2. Hospitalizations are defined in the glossary.

- **Trigger window:** *Trigger Window Start Date* and *Trigger Window End Date* are set using the potential trigger start and end dates which are defined in section 4.1. Only potential triggers that constitute an episode start can set the duration of a trigger window. The approach to determining whether a potential trigger is an episode start is described below.
- **Post-trigger window 1:** The output field *Post-trigger Window 1 Start Date* is set to the day after the output field *Trigger Window End Date*. The output field *Post-trigger Window 1 End Date* is set to the 15th day after the output field *Trigger Window End Date* (for a post-trigger window 1 of 15 days duration). If a hospitalization is ongoing on what would be the final day of the post-trigger window 1, the output field *Post-Trigger Window 1 End Date* is instead set to the input field *Discharge Date* of the hospitalization. A hospitalization is ongoing on the final day of the post-trigger window 1 if the hospitalization has an input field *Header From Date Of Service* during the first 15 days of the post-trigger window 1 and a *Discharge Date* beyond the first 15 days of the post-trigger window 1. If more than one hospitalization is ongoing on the 15th day of the post-trigger window 1, the latest *Discharge Date* present on a hospitalization sets the end date of the post-trigger window 1. Hospitalizations are defined in the glossary.
- **Post-trigger window 2:** The output field *Post-trigger Window 2 Start Date*, is set to the day after the output field *Post-trigger Window 1 End Date*. Regardless of the duration of the post-trigger window 1, the output field *Post-trigger Window 2 End Date* is set to the 30th day after the output field *Trigger Window End Date* (for post-trigger windows of 15 days duration). If a hospitalization extends the post-trigger window 1 beyond 30 days after the output field *Trigger Window End Date*, the post-trigger window 2 will have a duration of 0 days. If a hospitalization is ongoing on what would be the final day of the post-trigger window 2, the output field *Post-Trigger Window 2 End Date* is instead set to the input field *Discharge Date* of the hospitalization. A hospitalization is ongoing on the final day of the post-

trigger window 2 if the hospitalization has an input field *Header From Date Of Service* during the first 30 days of either post-trigger window 1 or 2 and a *Discharge Date* beyond the first 30 days of the post-trigger windows. If more than one hospitalization is ongoing on the 30th day of the post-trigger windows, the latest *Discharge Date* present on a hospitalization sets the end date of the post-trigger window 2. Hospitalizations are defined in the glossary. The output field *Post-trigger Window 2 End Date* is also the *Episode End Date*.

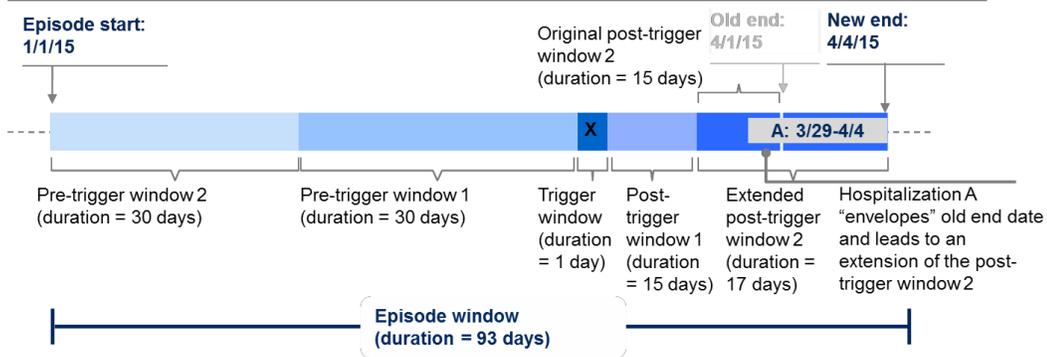

- **Clean period:** The clean period starts on the potential trigger start date and extends for 90 days from the potential trigger end date. The clean period is defined as the period during which, if the potential trigger triggers an episode, no new episode of the same type can be triggered. Note that the clean period is not part of the episode duration. The episode window ends with the post-trigger window 2, as defined above.

The extension of any one episode window due to a hospitalization may not lead to further extensions of that window, i.e., if the post-trigger window 1 is set based on the *Discharge Date* of a hospitalization and a different hospitalization starts during the extension of the post-trigger window 1 and ends beyond it the episode is not extended a second time (Exhibit 7).

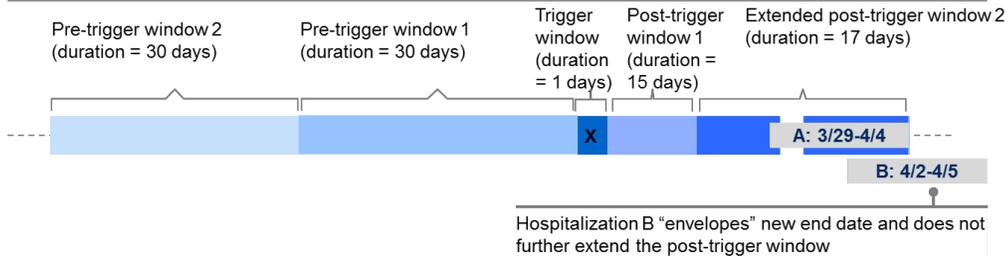

EXHIBIT 7 - EPISODE EXTENSIONS

X Potential trigger Pre-trigger window 2 Pre-trigger window 1 Trigger window
 Post-trigger window 1 Post-trigger window 2 Hospitalization

Example 1

Example 2

The combined duration of the pre-trigger window 2, pre-trigger window 1, trigger window, post-trigger window 1, and post-trigger window 2 is the episode window. All time windows are inclusive of their first and last date. For the definition of how the duration of time windows is calculated see the glossary.

The logic that determines the duration of the episode window assigns potential triggers to one of two groups:

- **Trigger Procedures:** Potential triggers that do not occur during another episode constitute the trigger window of a new episode.
- **Repeat Procedures:** Potential triggers that occur during the clean period of an episode do not constitute the trigger of a new episode.

To define episode windows for each patient a chronological approach is taken. The first trigger of a given patient is identified as the earliest (i.e., furthest in the past) potential trigger in the input data. Once the first trigger for a patient has been identified, the pre-trigger window 2, the pre-trigger window 1, the trigger window, the post-trigger window 1, the post-trigger window 2, and the clean period are set. If another potential trigger for the same patient starts within the clean period, it is classified as a repeat procedure. The next potential trigger that

starts outside of the clean period constitutes the second trigger for a given patient. The process of setting episode windows continues for each patient until the last episode window that ends during the input data date range is defined. There should be no overlap between the episode windows of any of the resulting episodes. Note that input date begins 14 months prior to the reporting window, so potential triggers may be repeat tooth extractions, and thus not trigger a tooth extraction episode, due to a tooth extraction that occurred prior to the reporting period.

The following special cases may occur when determining the episode duration:

- If two or more potential triggers of the same patient overlap, i.e., the start date of one potential trigger falls between the start date and the end date (inclusive) of one or more other potential triggers of the same patient, then only one of the overlapping potential triggers is chosen as a trigger procedure or repeat procedure. The other overlapping potential triggers do not count as trigger or repeat procedures, but are treated like any other claims. The following hierarchy is applied to identify the one potential trigger out of two or more overlapping potential triggers that is assigned as a trigger or repeat procedure:
 - The potential trigger with the earliest start date is selected.
 - If there is a tie, the potential trigger with the latest end date is selected.
 - If there is still a tie, the potential trigger with the lowest value for the output field *Trigger Claim ID* is selected.
- If the start date of a potential trigger occurs during the clean period of an episode but its end date is outside of the clean period of the episode, the potential trigger is neither a repeat procedure nor a trigger procedure, and the claim detail lines in the potential trigger are treated like any other claims.

To determine which claims and claim detail lines occur during an episode and before an episode the following assignment rules are used. In addition, specific rules apply to assign claims and claim detail lines to windows during the episode (the pre-trigger window 2, the pre-trigger window 1, the trigger window, the post-trigger window 1, the post-trigger window 2, and hospitalizations).

- **Assignment to the episode window:**
 - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the episode window if both

the input field *Header From Date Of Service* and the input field *Discharge Date* of the hospitalization occur during the episode window.

- Outpatient, dental, and professional claims are assigned to the episode window if at least one of their claim detail lines is assigned to the episode window. Outpatient and professional claim detail lines are assigned to the episode window if both input field *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the episode window.
- Pharmacy claims and all their claim detail lines are assigned to the episode window if both input fields *Header From Date Of Service* and *Header To Date Of Service* occur during the episode window.
- **Assignment to a window before the episode:**
 - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to a window before the episode (e.g., 365 days to 1 day before the output field *Episode Start Date*, 90 days to 1 day before the *Episode Start Date*) if the input field *Header From Date Of Service* of the hospitalization occurs during the specified time window before the output field *Episode Start Date*.
 - Outpatient, dental, and professional claims are assigned to a window before the episode if all their claim detail lines are assigned to the window before the episode. Outpatient and professional claim detail lines are assigned to a window before the episode if the input field *Detail From Date Of Service* occurs during the specified time window before the output field *Episode Start Date*.
 - Pharmacy claims and all their claim detail lines are assigned to a window before the episode if the input field *Header From Date Of Service* occurs during the specified time window before the *Episode Start Date*.
- **Assignment to the pre-trigger window 2:**
 - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the pre-trigger window 2 if both the input field *Header From Date Of Service* and the input field *Discharge Date* of the hospitalization occur during the pre-trigger window 2.
 - Outpatient, dental, and professional claims are assigned to the pre-trigger window 2 if all their claim detail lines are assigned to the pre-trigger window 2. Outpatient, dental, and professional claim detail lines are

assigned to the pre-trigger window 2 if both the input fields *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the pre-trigger window 2.

- Pharmacy claims and all their claim detail lines are assigned to the pre-trigger window 2 if both the input fields *Header From Date Of Service* and the *Header To Date Of Service* occur during the pre-trigger window 2.

■ **Assignment to the pre-trigger window 1:**

- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the pre-trigger window 1 if both the input field *Header From Date Of Service* and the input field *Discharge Date* of the hospitalization occur during the pre-trigger window 1.
- Outpatient, dental, and professional claims are assigned to the trigger window if all their claim detail lines are assigned to the pre-trigger window 1. Outpatient, dental, and professional claim detail lines are assigned to the pre-trigger window 1 if both the input fields *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the pre-trigger window 1.
- Pharmacy claims and all their claim detail lines are assigned to the pre-trigger window 1 if both the input fields *Header From Date Of Service* and the *Header To Date Of Service* occur during the pre-trigger window 1.

■ **Assignment to the trigger window:**

- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the trigger window if both the input field *Header From Date Of Service* and the input field *Discharge Date* of the hospitalization occur during the trigger window.
- Outpatient, dental, and professional claims are assigned to the trigger window if all their claim detail lines are assigned to the trigger window. Outpatient, dental, and professional claim detail lines are assigned to the trigger window if both the input fields *Detail From Date Of Service* and *Detail To Date Of Service* occur during the trigger window.

- Pharmacy claims and all their claim detail lines are assigned to the trigger window if both the input fields *Header From Date Of Service* and the *Header To Date Of Service* occur during the trigger window.
- **Assignment to the post-trigger window 1:**
 - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the post-trigger window 1 if the hospitalization is assigned to the episode window and also has input fields *Header From Date Of Service* and *Discharge Date* during the post-trigger window 1.
 - Outpatient, dental, and professional claims are assigned to the post-trigger window 1 if at least one of their claim detail lines is assigned to the post-trigger window 1. Outpatient, dental, and professional claim detail lines are assigned to the post-trigger window 1 if they are assigned to the episode window and also have an input field *Detail To Date Of Service* during the post-trigger window 1.
 - Pharmacy claims and all their claim detail lines are assigned to the post-trigger window 1 if they are assigned to the episode window and also have an input field *Header To Date Of Service* during the post-trigger window 1.
- **Assignment to the post-trigger window 2:**
 - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the post-trigger window 2 if the hospitalization is assigned to the episode window and also has input fields *Header From Date Of Service* and *Discharge Date* during the post-trigger window 2.
 - Outpatient, dental, and professional claims are assigned to the post-trigger window 2 if at least one of their claim detail lines is assigned to the post-trigger window 2. Outpatient, dental, and professional claim detail lines are assigned to the post-trigger window 2 if they are assigned to the episode window and also have an input field *Detail To Date Of Service* during the post-trigger window 2.
 - Pharmacy claims and all their claim detail lines are assigned to the post-trigger window 2 if they are assigned to the episode window and also have an input field *Header To Date Of Service* during the post-trigger window 2.

4.3 Identify claims included in episode spend

The third design dimension of building a tooth extraction episode is to identify which claims and claim detail lines are included in the calculation of episode spend. For short, such claims or claim detail lines are referred to as included claims or included claim detail lines. Claims or claim detail lines that are excluded from the calculation of episode spend are referred to as excluded claims or excluded claim detail lines.

Episode output fields created: *Count Of Included Claims*

Different rules for the inclusion of claims and claim detail lines apply to claims and claim detail lines assigned to the pre-trigger window 2, the pre-trigger window 1, the trigger window, the post-trigger window 1, and the post-trigger window 2. The assignment of claims and claim detail lines to windows during the episode is detailed in section 4.2.

- **Pre-trigger window 2:** Dental claims related to dental examination or imaging during the pre-trigger window 2 are included claims. Included claims during the pre-trigger window 2 fall into the following groups:
 - Dental evaluation and management (E&M) visits: If a dental claim detail line that is assigned to the pre-trigger window 2 contains an included dental evaluation and management (E&M) code in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included dental E&M codes under “Included Dental E&M Visits”.
 - Included imaging and testing: If a dental claim detail line that is assigned to the pre-trigger window 2 contains an included imaging and testing procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included imaging and testing procedure codes under “Included Imaging and Testing - Pre-trigger 2”.
- **Pre-trigger window 1:** Dental, outpatient, and professional claims during the pre-trigger window 1 that are related to the tooth extraction procedure are included claims. Included claims during the pre-trigger window 1 fall into the following groups:
 - Dental evaluation and management (E&M) visits: If a dental claim detail line that is assigned to the pre-trigger window 1 contains an included dental evaluation and management (E&M) code in the input field *Detail*

Procedure Code, then the claim detail line is an included claim detail line. The configuration file lists included dental E&M codes under “Included Dental E&M Visits”.

- Related evaluation and management (E&M) visits: If an outpatient or professional claim detail line that is assigned to the pre-trigger window 1 contains an included evaluation and management (E&M) code in the input field *Detail Procedure Code* and a relevant diagnosis code in the input field *Header Diagnosis Code Primary*, then the claim detail line is an included claim detail line. The configuration file lists included E&M codes and relevant diagnosis codes under “Included E&M Visits” and “Included Relevant Diagnoses” respectively. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
- Included imaging and testing: If a dental, outpatient, or professional claim detail line that is assigned to the pre-trigger window 1 contains an included imaging and testing procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included imaging and testing procedure codes under “Included Imaging and Testing – Pre-trigger 1”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
- Included procedures: If a dental, outpatient, or professional claim detail line that is assigned to the pre-trigger window 1 contains an included procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included imaging and testing procedure codes under “Included Procedures - Pre-trigger 1”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
- Included medications: If a pharmacy claim that is assigned to the pre-trigger window 1 contains an included medication code found in the input field *National Drug Code*, then the claim is an included claim. The configuration file lists included medications under “Included Medications - Pre-trigger 1” using Hierarchical Ingredient Code Level 3 (HIC3)

identifiers provided by First Databank. To search for included medications, the HIC3 codes must be cross-walked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.

- Excluded evaluation and management (E&M) visits: If an outpatient, dental, or professional claim detail line that is assigned to the pre-trigger window 1 contains an evaluation and management (E&M) code for emergency department, observation, or urgent care in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line. The configuration file lists excluded E&M codes under “Excluded ED Observation Room and Urgent Care Center Facility Visits”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the excluded claim detail line are also excluded claim detail lines.
- **Trigger window:** All dental claims during the trigger window are included. Outpatient, professional, and pharmacy claims during the trigger window that are related to the tooth extraction procedure are included claims. Included claims during the trigger window fall into the following groups:
 - Dental claims: All dental claims are included in the trigger window.
 - Included diagnoses: If an outpatient or professional claim assigned to the trigger window contains an included diagnosis code in the input field *Header Diagnosis Code Primary* then all claim detail lines of the claim are included claim detail lines. The configuration file lists included diagnosis codes under “Included Diagnoses - Trigger and Post-trigger 1”.
 - Included imaging and testing: If an outpatient or professional claim detail line that is assigned to the trigger window contains an included imaging and testing procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included imaging and testing procedure codes under “Included Imaging and Testing - Trigger and Post-trigger 1”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.

- Included procedures: If an outpatient or professional claim detail line that is assigned to the trigger window contains an included anesthesia, surgical, or medical procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included procedure codes under “Included Procedures - Trigger and Post-trigger 1”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
- Included medications: If a pharmacy claim that is assigned to the trigger window contains an included medication code found in the input field *National Drug Code*, then the claim is an included claim. The configuration file lists included medications under “Included Medications - Trigger” using Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank. To search for included medications, the HIC3 codes must be cross-walked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.
- Excluded procedures: If a dental claim detail line that is assigned to the trigger window contains an excluded dental procedure in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line. The configuration file lists excluded procedure codes under “Excluded Procedures”.
- **Post-trigger window 1:** Outpatient, dental, professional, and pharmacy claims during the post-trigger window 1 that are related to the tooth extraction procedure, or indicate potential complications, are included claims. Included claims during the post-trigger window 1 fall into the following groups:
 - Dental evaluation and management (E&M) visits: If a dental claim detail line that is assigned to the post-trigger window 1 contains an included dental evaluation and management (E&M) code in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included dental E&M codes under “Included Dental E&M Visits”.
 - Included diagnoses: If an outpatient, dental, or professional claim assigned to the post-trigger window 1 contains an included diagnosis code

in the input field *Header Diagnosis Code Primary* then all claim detail lines of the claim are included claim detail lines. The configuration file lists included diagnosis codes under “Included Diagnoses - Trigger and Post-trigger 1”.

- Included imaging and testing: If a dental, outpatient, or professional claim detail line that is assigned to the post-trigger window 1 contains an included imaging and testing procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included imaging and testing procedure codes under “Included Imaging and Testing - Trigger and Post-trigger 1”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
- Included procedures: If an outpatient, dental, or professional claim detail line that is assigned to the post-trigger window 1 contains an included anesthesia, surgical, or medical procedure in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. The configuration file lists included procedure codes under “Included Procedures - Trigger and Post-trigger 1”. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the included claim detail line are also included claim detail lines.
- Included medications: If a pharmacy claim that is assigned to the post-trigger window 1 contains an included medication code found in the input field *National Drug Code*, then the claim is an included claim. The configuration file lists included medications under “Included Medications - Post-trigger 1” using Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank. To search for included medications, the HIC3 codes must be cross-walked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.
- **Post-trigger window 2:** Included claims during the post-trigger window 1 fall into the following group:
 - Pharmacy claims that are assigned to the post-trigger window 2 are checked for included medications. If a pharmacy claim that is assigned to

the post-trigger window 2 contains an included medication code found in the input field *National Drug Code*, then the claim is an included claim. The configuration file lists included medications under “Included Medications - Post-trigger 2” using Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank. To search for included medications, the HIC3 codes must be cross-walked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.

- **Episode window:** Outpatient, dental, and professional claim detail lines that are assigned to the episode window are checked for excluded procedures. These exclusions supersede any other reason a claim detail line might be included.
 - Excluded transportation: If an outpatient or professional claim detail line that is assigned to the episode window contains an excluded transportation procedure code in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line. The configuration file lists excluded vaccination procedure codes under “Excluded Transportation Procedures”. This exclusion of claim detail lines takes precedence over any other inclusion logic. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the excluded claim detail line are also excluded claim detail lines.
 - Excluded vaccinations: If an outpatient or professional claim detail line that is assigned to the episode window contains an excluded vaccination procedure code in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line. The configuration file lists excluded transportation procedure codes under “Excluded Vaccine Administrations”. This exclusion of claim detail lines takes precedence over any other inclusion logic. For outpatient claims, all other claim detail lines on the same claim with the same *Detail From Date Of Service* and *Detail To Date Of Service* as the excluded claim detail line are also excluded claim detail lines.
 - Excluded hospitalizations: All hospitalizations that are assigned to the episode window are excluded hospitalizations. All pharmacy claims as well as all outpatient and professional claim detail lines assigned to an excluded hospitalization are excluded claims or excluded claim detail

lines, regardless of whether they contain included diagnosis, procedure, or medication codes.

- Excluded long-term care: If a long-term care claim is assigned to the episode window, then all claim detail lines of the claim are excluded from the episode. Long-term care claims are defined in the Glossary under ‘Claim Types’ This exclusion of claim detail lines takes precedence over any other inclusion logic.
- Not included claims: Any claim or claim detail line not explicitly included during the episode window is an excluded claim or excluded claim detail line.

The output field *Count Of Included Claims* is defined as the number of unique claims that contribute to episode spend. For the purpose of calculating counts of claims, a claim is counted as contributing to episode spend if it is an included claim or if one or more of its claim detail lines are included claim detail lines. The output field *Count Of Included Claims* is calculated overall as well as broken out by claim type, by window during the episode, and by claim type and window during the episode. Breakouts by window are calculated based on the window to which each claim is assigned.

4.4 Calculate non-risk adjusted episode spend

The fourth design dimension of building a tooth extraction episode is to calculate the non-risk-adjusted spend for each episode.

Episode output fields created: *Non-risk-adjusted Episode Spend, Normalized-non-risk-adjusted Episode Spend*

PAP output fields created: *Average Non-risk-adjusted PAP Spend, Total Non-risk-adjusted PAP Spend*

The *Non-risk-adjusted Episode Spend* is defined as the sum of:

- The spend for included, header-paid inpatient claims. The spend for each included, header-paid inpatient claim is calculated as the value in the input field *DRG Base Payment* plus the values in the input fields *DRG Outlier Payment A* and *DRG Outlier Payment B*. Header-paid inpatient claims are identified based on an input field *Header Or Detail Indicator* of ‘H’. Other components of the DRG payment are not taken into account. Ohio Medicaid has a methodology to derive this clinical component of care for relevant

encounters using the relative weights for each DRG-SOI combination and hospital rates as posted on the Ohio Medicaid website (<http://medicaid.ohio.gov/PROVIDERS/FeeScheduleandRates/SchedulesandRates.aspx#1682575-inpatient-hospital-services>).

- The spend for included, detail-paid inpatient claims. The spend for each included, detail-paid inpatient claim is calculated as the sum of the input fields *Detail Paid Amount* for claims from MCPs and the sum of the inputs fields *Detail Allowed Amount* for claims from FFS.
- The *Header Paid Amount* of included pharmacy claims from MCPs.
- The *Header Allowed Amount* of included pharmacy claims from FFS.
- The *Detail Paid Amount* for included outpatient and professional claim detail lines from MCPs.
- The *Detail Allowed Amount* for included outpatient and professional claim detail lines from FFS.

Claims from MCPs and FFS are distinguished based on the input field *FFS Or MCP Indicator*. A value of ‘E’ in the input field *FFS Or MCP Indicator* indicates an MCP claim; a value of ‘F’ indicates a FFS claim. The output field *Non-risk-adjusted Episode Spend* is calculated overall and broken out by claim type, by window during the episode, and by claim type and window during the episode.

The *Normalized-non-risk-adjusted Episode Spend* is defined as the sum of:

- The normalized spend for included, header-paid inpatient claims. The normalized spend for each included, header-paid inpatient claim is calculated as the value in the input field *DRG Base Payment* multiplied by the ratio of the *Normalized Base Rate* to the *Base Rate* plus the values in the input fields *DRG Outlier Payment A* and *DRG Outlier Payment B*. The configuration file lists the *Normalized Base Rate* as a parameter under “Episode Spend.” The *Base Rate* is determined by looking up the appropriate value in the input field *Base Rate* from the APR-DRG Base Rate Table using the input field *Provider ID* to link to the *Billing Provider ID* of each included, header-paid inpatient claim. Header-paid inpatient claims are identified based on a *Header Or Detail Indicator* of ‘H’. Other components of the DRG payment are not taken into account.
- The spend for included, detail-paid inpatient claims. The spend for each included, detail-paid inpatient claim is calculated as the sum of the input

fields *Detail Paid Amount* for claims from MCPs and the sum of the inputs fields *Detail Allowed Amount* for claims from FFS.

- The *Header Paid Amount* of included pharmacy claims from MCPs.
- The *Header Allowed Amount* of included pharmacy claims from FFS.
- The *Detail Paid Amount* for included outpatient and professional claim detail lines from MCPs.
- The *Detail Allowed Amount* for included outpatient and professional claim detail lines from FFS.

If a claim detail line is included for two or more reasons (e.g., due to an included diagnosis and an included procedure), its *Detail Allowed Amount* or *Detail Paid Amount* counts only once towards the *Non-risk-adjusted Episode Spend* or the *Normalized-non-risk-adjusted Episode Spend*.

For the provider reports, the fields *Average Non-risk-adjusted PAP Spend* and *Total Non-risk-adjusted PAP Spend* are added to the PAP output table. *Average Non-risk-adjusted PAP Spend* is calculated as the average of the *Non-risk-adjusted Episode Spend* across valid episodes for a given PAP. *Total Non-risk-adjusted PAP Spend* is calculated as the sum of the *Non-risk-adjusted Episode Spend* across valid episodes for a given PAP. See section 4.5 for the identification of PAPs and section 4.6 for the definition of valid episodes.

The *Average Non-risk-adjusted PAP Spend* is shown overall as well as broken out by claim type, by window during the episode, and by claim type and window during the episode. The breakouts of *Average Non-risk-adjusted PAP Spend* are calculated in two ways:

- Breakout A: The averages are calculated across all valid episodes of a PAP.
- Breakout B: The averages are calculated across valid episodes of a PAP that have spend greater zero dollars (>\$0) in the category that is broken out.

For example, a PAP has 100 valid episodes and 80 of the episodes have any inpatient spend, the remaining 20 do not have any inpatient spend. To calculate breakout A for *Average Non-risk-adjusted PAP Spend Inpatient*, the denominator is 100 valid episodes. To calculate breakout B for *Average Non-risk-adjusted PAP Spend Inpatient* the denominator is 80 valid episodes with any inpatient spend.

4.5 Identify Principal Accountable Providers

The fifth design dimension of building a tooth extraction episode is to assign each episode to a Principal Accountable Provider (PAP).

Episode output fields created: *PAP ID, PAP Name, Rendering Provider ID, Rendering Provider Name*

PAP output fields created: *PAP ID, PAP Name, PAP Address Line 1, PAP Address Line 2, PAP City, PAP State, PAP Zip Code*

The output field *PAP ID* is set using the input field *Billing Provider ID* on the claim that is used to set the output field *Trigger Claim ID*.

The output field *Rendering Provider ID* is set using the input field *Rendering Provider ID* of the claim that is used to set the output field *Trigger Claim ID*.

The output fields *PAP Name, PAP Address Line 1, PAP Address Line 2, PAP City, PAP State, and PAP Zip Code* are set based on the Provider Extract input fields *Provider Name, Practice Address Line 1, Practice Address Line 2, Practice City, Practice State, and Practice Zip Code*, respectively. The output fields are linked to the Provider Extract by matching the output field *PAP ID* to the input field *Provider ID* of the Provider Extract.

The output field *Rendering Provider Name* is set based on the Provider Extract input field *Provider Name*. The output field is linked to the Provider Extract by matching the output field *Rendering Provider ID* to the input field *Provider ID* of the Provider Extract.

4.6 Identify excluded episodes

The sixth design dimension of building a tooth extraction episode is to identify episodes that are excluded from the episode-based payment model.

Episode output fields created: *Any Exclusion, Exclusion Age, Exclusion Death, Exclusion Dual Eligibility, Exclusion FQHC RHC, Exclusion High Outlier, Exclusion Incomplete Episode, Exclusion Inconsistent Enrollment, Exclusion Left Against Medical Advice, Exclusion Long Hospitalization, Exclusion Long-term Care, Exclusion Missing DRG, Exclusion Multiple Other Comorbidities, Exclusion Multiple Payers, Exclusion No PAP, Exclusion PAP Out Of State, Exclusion Dental Extraction CPT, Exclusion Third-party Liability, Exclusion <Comorbidity Name>*

Each *Exclusion <name of exclusion>* output field indicates whether an episode is excluded for a given reason and therefore invalid for the purpose of the episode based payment model. If an episode is excluded for more than one reason each exclusion is indicated. The output field *Any Exclusion* indicates whether an episode contains any exclusion. Episodes may be excluded for business reasons, for clinical reasons, or because they are outliers. After all exclusions have been applied, a set of valid episodes remains.

Business exclusions

- **Dual eligibility:** An episode is excluded if the patient had dual coverage by Medicare and Medicaid during the episode window. Dual coverage is determined using the *Eligibility Start Date* and *Eligibility End Date* from the Member Extract where the *Aid Category* indicates dual coverage. *Aid Category* codes that indicate dual coverage are listed in the configuration file under “Business Exclusions - Duals”. Note that only the first digit of the *Aid Category* code is used for this purpose.

A patient is considered to have dual coverage during the episode window if the patient’s *Eligibility Start Date* for dual coverage falls before or on (\leq) the *Episode End Date* and the *Eligibility End Date* for dual coverage falls on or after (\geq) the *Episode Start Date*. The input field *Member ID* is linked to the output field *Member ID* from the Member Extract to identify the enrollment information for each patient.

If a patient has an *Eligibility Start Date* without a corresponding *Eligibility End Date* for dual coverage, the dual coverage is considered to be ongoing through the last date of the input data.

If a patient had dual coverage before or after the episode window, but not during the episode window, the episode is not excluded.

- **FQHC/RHC:** An episode is excluded if the PAP is classified as a federally qualified health center or rural health clinic. A PAP is determined to be a FQHC or RHC if the input field Billing Provider Type of the PAP is listed in the configuration file under “Business Exclusions - FQHC And RHC”.
- **Incomplete episodes:** An episode is excluded if the *Non-risk-adjusted Episode Spend* (not the *Risk-adjusted Episode Spend*) is less than ($<$) the incomplete episode threshold. The incomplete episode threshold is listed as a parameter in the configuration file under “Excluded Episodes”.

- **Inconsistent enrollment:** An episode is excluded if the patient was not continuously enrolled in Ohio Medicaid during the episode window. Enrollment is verified using the input fields *Eligibility Start Date* and *Eligibility End Date* from the Member Extract where the input field *Aid Category* indicates full Medicaid enrollment. *Aid Category* codes that indicate full Medicaid enrollment are listed in the configuration file under “Business Exclusions - Inconsistent Enrollment”. Note that only the first digit of the *Aid Category* code is used for this purpose.

A patient is considered continuously enrolled if the patient’s *Eligibility Start Date* for full Medicaid falls before or on (\leq) the *Episode Start Date* and the *Eligibility End Date* for full Medicaid falls on or after (\geq) the *Episode End Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the enrollment information for each patient.

A patient may have multiple entries for *Eligibility Start Date* and *Eligibility End Date* for full Medicaid and some of the dates may be overlapping. In such cases, continuous, non-overlapping records of a patient’s enrollment are created before confirming whether the patient was continuously enrolled during an episode. If a patient has an *Eligibility Start Date* without a corresponding *Eligibility End Date* for full Medicaid, enrollment is considered to be ongoing through the last date of the input data.

If a patient was not continuously enrolled in Ohio Medicaid before or after the episode window, but was continuously enrolled during the episode window, the episode is not excluded.

- **Long hospitalization:** An episode is excluded if a hospitalization that is assigned to the episode window has a duration greater than the threshold for long hospitalizations. The hospitalization may or may not be included in the episode spend. The long hospitalization threshold is listed as a parameter in the configuration file under “Excluded Episodes”.
- **Long-term care:** An episode is excluded if the patient has one or more long-term care claim detail lines which overlap the episode window. A long-term care claim detail line which overlaps the episode window is defined as one with both a *Detail From Date Of Service* on or prior to (\leq) the *Episode End Date* and a *Detail To Date Of Service* on or after (\geq) the *Episode Start Date*. The long-term care claim detail line may or may not be included in the episode spend.

- **Missing APR-DRG:** An episode is excluded if a header-paid inpatient claim assigned to the episode window has an invalid or missing value in the input fields *APR-DRG* or *Severity Of Illness*. Header-paid inpatient claims are identified based on a *Header Or Detail Indicator* of ‘H’.
- **Multiple payers:** An episode is excluded if a patient changes enrollment between MCPs during the trigger window or during the post-trigger window(s) (if applicable). Episodes are identified as having multiple payers if there is an inpatient, outpatient, dental, professional, or pharmacy claim that meets all of the following conditions:
 - The claim is assigned to the trigger window or the post-trigger window(s) of the episode (if applicable)
 - The input field FFS Or MCP Indicator of the claim is not "FFS"
 - The input field MCP ID on the claim is not null and does not belong to the same payer that the episode is attributed to. Since a payer may be associated with multiple MCP IDs, the input field *MCP ID* must be cross-walked to a payer name. An updated crosswalk including current and historical MCP IDs must be used for each reporting period

If a patient changes enrollment between MCPs during the pre-trigger window (if any) or before the episode window, it is the responsibility of the payer to whom the episode is attributed to utilize the claims history of the patient with the prior payer to build the episode. Attribution of an episode to a payer is defined in the glossary under “Payer Attribution”.

- **No PAP:** An episode is excluded if the PAP cannot be identified. A PAP cannot be identified if the *Billing Provider ID* is not available.
- **PAP out of state:** An episode is excluded if the PAP has a practice address outside of Ohio. The state of the practice address is determined using the output field *PAP State*. The code used to identify the state of Ohio is listed in the configuration file under “Business Exclusions - PAP Out Of State”.
- **Third-party liability:** An episode is excluded if either:
 - An inpatient, outpatient, dental, or professional claim that is assigned to the episode window is associated with a third-party liability amount. A claim is considered to be associated with a third-party liability amount if either the input field *Header TPL Amount* or any of the input fields *Detail TPL Amount* have a value greater than (>) zero. The claim with a positive

TPL amount may or may not be included in the calculation of episode spend.

As an exception, a third party liability amount in the input field *Header TPL Amount* or the input field *Detail TPL Amount* of a professional FFS claim from an FQHC or RHC does not lead to exclusion of the episode if the episode is attributed to an MCP. Professional claims from FQHC or RHC are identified based on one or more detail lines that are assigned to the episode window and also have a *Place Of Service* of FQHC or RHC. The relevant values for *Place Of Service* are listed in the configuration file under “Business Exclusions - TPL Exempt Places Of Service”. Claims from FFS are identified based on the input field *FFS Or MCP Indicator* having a value of ‘F’. Attribution of an episode to a payer is defined in the glossary under “Payer attribution”.

- A patient was enrolled with a relevant source of third party liability during the episode window. Enrollment is verified using the *TPL Effective Date* and *TPL End Date* from the Member Extract where the *Coverage Type* indicates relevant TPL coverage. *Coverage Type* codes that indicate relevant TPL are listed in the configuration file under “Business Exclusions - TPL Relevant Coverage”.

A patient is considered enrolled with a relevant source of TPL if the patient’s *TPL Effective Date* falls before or on (\leq) the *Episode End Date* and the *TPL End Date* falls on or after (\geq) the *Episode Start Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the enrollment information for each patient.

If a patient has a *TPL Effective Date* without a corresponding *TPL End Date* the enrollment with a relevant source of TPL is considered to be ongoing through the last date of the input data.

If a patient was enrolled with a relevant TPL source before or after the episode window, but was not enrolled during the episode window, the episode is not excluded.

Clinical exclusions

- **Age:** An episode is excluded if the output field *Member Age* does not fall into the valid age range or if it is invalid. See the glossary for the definition of *Member Age*. The valid age ranges for the episode are listed as parameters in the configuration file under “Excluded Episodes”.

- **Comorbidity:** An episode is excluded if the patient has a comorbidity code during a specified time window. Each comorbidity exclusion listed in the configuration file sets a separate output field named *Exclusion <Name Of Comorbidity>*. For example, the HIV comorbidity exclusion sets the output field *Exclusion HIV* for all those episodes with evidence of HIV during the specified time period. The following approaches are used to identify comorbidities:
 - Comorbidity diagnosis codes are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims that are assigned to the specified time windows. The configuration file lists the codes and time windows under “Comorbidities <name of comorbidity> - Diagnoses”.
 - Comorbidity CPT and HCPCS procedure codes are searched for in the input field *Detail Procedure Code* of outpatient and professional claim detail lines that are assigned to the specified time windows. The configuration file lists the codes and time windows used under “Comorbidities <name of comorbidity> - Procedures”.
 - Comorbidity ICD-9 and ICD-10 procedure codes are searched for in the input fields *Surgical Procedure Code Primary* and *Surgical Procedure Code 2-24* of inpatient claims that are assigned to the specified time windows. The configuration file lists the codes and time windows used under “Comorbidities <name of comorbidity> - Procedures”.
 - Comorbidity contingent cancer codes require both the presence of a cancer diagnosis code and also an indicator of active cancer treatment during the specified time window:
 - Cancer diagnosis codes are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer - Diagnoses”.
 - An indicator of active cancer treatment is the presence of either a diagnosis or procedure code for active cancer treatment during the specified time window. The indicator may occur on the same claim as a cancer diagnosis code or on a different claim. The following approaches are taken to identify active cancer treatment:

- Diagnosis codes for active cancer treatment are searched for in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims that are assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer Active - Diagnoses”.
- CPT and HCPCS codes for active cancer treatment are searched for in the input field *Detail Procedure Code* of outpatient and professional claim detail lines that are assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer Active - Procedures”.
- ICD-9 and ICD-10 procedure codes for active cancer treatment are searched for in the input fields *Surgical Procedure Code Primary* and *Surgical Procedure Code 2-24* of inpatient claims that are assigned to the specified time window. The configuration file lists the codes and time windows used under “Comorbidities Cancer Active - Procedures”.

The claims and claim detail lines that are searched for comorbidities do not have to be included claims or included claim detail lines. If a patient lacked continuous eligibility during the year before the episode or during the episode window, comorbidities are checked in the data available.

- **Death:** An episode is excluded if either:
 - The patient has a *Patient Status Indicator* of “Expired” on any inpatient or outpatient claim assigned to the episode window. The claim may be an included claim or not. The values of the *Patient Status Indicator* used to identify whether the patient expired are listed in the configuration file under “Clinical Exclusions - Death”.
 - The input field *Date Of Death* in the Member Extract contains a date before or equal to the *Episode End Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the *Date Of Death* for each patient.
- **Dental extraction CPT:** An episode is excluded if it meets both the following conditions:
 - A medical or outpatient trigger claim with presence of a CPT code for extraction in the input field *Detail Procedure Code*. The configuration file

lists the CPT codes for extraction under “Dental Procedure CPT - Procedures”. The trigger claim is the claim having the same value in the input field *Internal Control Number* as what is in the output field *Trigger Claim ID*.

- No dental, medical, or outpatient claims assigned to the trigger window that include CDT codes for extraction in the input field *Detail Procedure Code*. The configuration file lists the CDT codes for extraction under “Dental Procedure CDT - Procedures”.
- **Left against medical advice:** An episode is excluded if the patient has an input field *Patient Status Indicator* of “Left Against Medical Advice or Discontinued Care” on any inpatient or outpatient claim assigned to the episode window. The claim may be an included claim or not. The value of the *Patient Status Indicator* used to identify whether the patient left against medical advice is listed in the configuration file under “Clinical Exclusions - Left Against Medical Advice”.
- **Multiple other comorbidities:** An episode is excluded if it is affected by too many risk factors to reliably risk adjust the episode spend. The output fields *Risk Factor <risk factor number>* as defined in section 4.8 are used to identify how many risk factors affect an episode. Each output field *Risk Factor <risk factor number>* indicates whether an episode is affected by one risk factor. If an episode is affected by more (>) risk factors than the value listed as a parameter in the configuration file under “Excluded Episodes”, the episode is excluded.

Outliers

- **High outlier:** An episode is excluded if the output field *Risk-adjusted Episode Spend* (not the *Non-risk-adjusted Episode Spend*) is above (>) the high outlier threshold. The high outlier threshold was set based on analyses of episode spend distributions for episodes that ended between the beginning of October 2014 and the end of September 2015 inclusive. It was set at three standard deviations above the average risk-adjusted episode spend for otherwise valid episodes. The high outlier threshold is listed as a parameter in the configuration file under “High Outlier”. See section 4.8 for the definition of *Risk-adjusted Episode Spend*.

4.7 Identify Principal Accountable Providers who pass the quality metrics

The seventh design dimension of building a tooth extraction episode is the calculation of the quality metrics and the identification of PAPs who meet the quality metrics performance requirement.

Episode output fields created: *Quality Metric 01a Indicator, Quality Metric 01b Indicator, Quality Metric 02 Indicator, Quality Metric 03a Indicator, Quality Metric 03b Indicator, Quality Metric 04a Indicator, Quality Metric 04b Indicator, Quality Metric 05a Indicator, Quality Metric 05b Indicator, Quality Metric 06 Indicator, Quality Metric 07 Indicator, Quality Metric 08a Indicator, Quality Metric 08b Indicator, Quality Metric 09a Indicator, Quality Metric 09b Indicator*

PAP output fields created: *PAP Quality Metric 01 Performance, PAP Quality Metric 02 Performance, PAP Quality Metric 03 Performance, PAP Quality Metric 04 Performance, PAP Quality Metric 05 Performance, PAP Quality Metric 06 Performance, PAP Quality Metric 07 Performance, PAP Quality Metric 08 Performance, PAP Quality Metric 09 Performance*

The tooth extraction episode has two quality metrics that are tied to gain sharing and seven informational quality metrics. Informational quality metrics are not tied to gain sharing.

Quality metrics 1, 3, and 4 utilize several terms that are defined in advance in order to simplify the logic when those metrics are presented below:

- **Opioid Pharmacy Claim:** Opioid Pharmacy Claims are identified by matching pharmacy claims to the CDC Oral Morphine Milligram Equivalents Table after completing all data manipulations described in section 3.1 A pharmacy claim is considered an Opioid Pharmacy Claim if the input field *National Drug Code* is equal to the input field *NDC (MME)*.
- **Prescription End Date:** For each Opioid Pharmacy Claim the Prescription End Date is set to the xth day after the *Header From Date Of Service* minus one day. The value of the xth day is provided by the input field *Days Supply* on the Opioid Pharmacy Claim.
- **Pre-trigger Opioid Window:** The period prior to the *Trigger Window Start Date* during which the average morphine equivalent dose (MED) per day metric is calculated. The relevant duration ranges are listed as parameters in

the configuration file under “Quality Metrics” and are inclusive of the minimum (\geq) and maximum (\leq) values. Opioid Pharmacy Claims in this time period are identified by having either a *Header From Date Of Service* in the Pre-trigger Opioid Window, a Prescription End Date in the Pre-trigger Opioid Window, or a *Header From Date of Service* prior to the Pre-Trigger Opioid Window and a Prescription End Date after the Pre-Trigger Opioid Window. All three scenarios are inclusive of first and last days of the Pre-trigger Opioid Window. The duration and timing of the Pre-trigger Opioid Window is specific to a given episode and therefore will not be the same across episodes.

- **Post-trigger Opioid Window:** The period during and after the *Trigger Window Start Date* during which the average MED/day metric is calculated. The relevant duration ranges are listed as parameters in the configuration file under “Quality Metrics” and are inclusive of the minimum (\geq) and maximum (\leq) values. Opioid Pharmacy Claims in this time period are identified by having either a *Header From Date Of Service* in the Post-trigger Opioid Window, a Prescription End Date in the Post-trigger Opioid Window, or a *Header From Date of Service* prior to the Post-Trigger Opioid Window and a Prescription End Date after the Post-trigger Opioid Window. All three scenarios are inclusive of first and last days of the Post-trigger Opioid Window. The duration and timing of the Post-trigger Opioid Window is specific to a given episode and therefore will not be the same across episodes.
- **Pre-trigger Opioid Fill Duration:** the number of days in the Pre-trigger Opioid Window for which there is an opioid filled. The Pre-trigger Opioid Fill Duration is less than or equal to the Pre-trigger Opioid Window. It is calculated as the difference between the following dates plus one day:
 - The later of the following two dates: the start of the Pre-trigger Opioid Window and the *Header From Date Of Service* of the chronologically first Opioid Pharmacy Claim identified in the Pre-trigger Opioid Window as defined above.
 - The earlier of the following two dates: the end of the Pre-trigger Opioid Window and the latest Prescription End Date of Opioid Pharmacy Claims identified in the Pre-trigger Opioid Window as defined above.
- **Post-trigger Opioid Fill Duration:** the number of days in the Post-trigger Opioid Window for which there is an opioid filled. The Post-trigger Opioid

Fill Duration is less than or equal to the Post-trigger Opioid Window. It is calculated as the difference between the following dates plus one day:

- The later of the following two dates: the start of the Post-trigger Opioid Window and the *Header From Date Of Service* of the chronologically first Opioid Pharmacy Claim identified in the Post-trigger Opioid Window as defined above.
- The earlier of the following two dates: the end of the Post-trigger Opioid Window and the latest Prescription End Date of Opioid Pharmacy Claims identified in the Post-trigger Opioid Window as defined above.

Quality metrics tied to gain-sharing for the tooth extraction episode:

■ Quality metric 1: Difference in Average MED/day

- The output field *Quality Metric 01a Indicator* is set for each episode as the difference between the average MED/day for the Post-trigger Opioid Window (minuend) minus the average MED/day for the Pre-trigger Opioid Window (subtrahend). The value is calculated only for valid episodes with an Opioid Pharmacy Claim assigned to the episode window. Assignment to the episode window is detailed in section 4.2.
- The minuend represents the average MED/day for the Post-trigger Opioid Window. The calculation is determined in a series of steps:
 - First, Opioid Pharmacy Claims in the Post-trigger Opioid Window are identified as previously stated in the Post-trigger Opioid Window definition.
 - Second, the total MED is calculated for each individual Opioid Pharmacy Claim identified in the previous step. For each claim, the total MED is calculated based on the formula below:

$$[\text{Total MED}] = [\text{Strength}] \times [\text{Conversion Factor}] \times [\text{Quantity}].$$

The *Strength* and *Conversion Factor* are retrieved from the CDC Oral Morphine Milligram Equivalents table while the input field *Quantity* is identified on the Opioid Pharmacy Claim.

- Third, for each Opioid Pharmacy Claim, the Total MED value must be prorated if the *Header From Date Of Service* and/or Prescription End Date of the Opioid Pharmacy Claim falls outside the Post-trigger Opioid Window. Specifically, proration occurs when:

- The *Header From Date Of Service* for the Opioid Pharmacy Claim is before the start of the Post-trigger Opioid Window and / or
- The Prescription End Date extends beyond the end of the Post-Trigger Opioid Window.

Proration is done as follows:

- Prorated total MED: Total MED * percent of an Opioid Pharmacy Claim's *Days Supply* that falls within the Post-trigger Opioid Window. The percent of an Opioid Pharmacy Claim's duration within the Post-trigger Opioid Window is calculated as follows:

(a) Case 1: the Opioid Pharmacy Claim's *Header From Date Of Service* is prior to the start of the Post-trigger Opioid Window and the Prescription End Date is within the Post-trigger Opioid Window. The percent of the Opioid Pharmacy Claim's *Days Supply* within the Post-trigger Opioid Window is calculated as the difference between the Prescription End Date and the start of the Post-trigger Opioid Window, plus one day. The result of this is divided by the Opioid Pharmacy Claim's *Days Supply* to yield the percent of the Opioid Pharmacy Claim's *Days Supply* that falls within the Post-trigger Opioid Window.

(b) Case 2: the Opioid Pharmacy Claim's *Header From Date Of Service* is within the Post-trigger Opioid Window and its Prescription End Date is after the end of the Post-trigger Opioid Window. The percent of the Opioid Pharmacy Claim's *Days Supply* within the Post-trigger Opioid Window is calculated as the difference between the end of the Post-trigger Opioid Window and the Opioid Pharmacy Claim's *Header From Date Of Service*, plus one day. The result is divided by the Opioid Pharmacy Claim's *Days Supply* to yield the percent of the Opioid Pharmacy Claim's *Days Supply* that falls within the Post-trigger Opioid Window.

(c) Case 3: the Opioid Pharmacy Claim's *Header From Date Of Service* is prior to the start of the Post-trigger Opioid Window and the Prescription End Date is after the Post-trigger Opioid

Window. The percent of the Opioid Pharmacy Claim's *Days Supply* within the Post-trigger Opioid Window is calculated as the Post-trigger Opioid Window (inclusive of the first and last days) divided by the Opioid Pharmacy Claim's *Days Supply*.

- Fourth, the average MED/day for the Post-Trigger Opioid Window is calculated by summing the total MED or prorated total MED for each Opioid Pharmacy Claim in the Post-trigger Opioid Window and dividing by the Post-trigger Opioid Fill Duration.
- The subtrahend represents the average morphine equivalent dose (MED) per day for the Pre-trigger Opioid Window. The calculation is determined using the same methodology as that for the minuend except the Pre-trigger Opioid Window is used in place of the Post-trigger Opioid Window.
- The output field *Quality Metric 01b Indicator* marks episodes with at least one Opioid Pharmacy Claim assigned to the episode window. Assignment to the episode window is detailed in section 4.2.
- The output field *PAP Quality Metric 01 Performance* is expressed in units of MEDs for each Quarterback based on the following ratio:
 - Numerator: Sum of all MED/day values as calculated in *Quality Metric 01a Indicator* across valid episodes of the *PAP ID* with at least one Opioid Pharmacy Claim during the episode window
 - Denominator: Number of valid episodes of the *PAP ID* with at least one Opioid Pharmacy Claim during the episode window as indicated by the *Quality Metric 01b Indicator*
- **Quality metric 2: Related post-trigger emergency department (ED) visits**
 - The output field *Quality Metric 02 Indicator* marks valid episodes that have at least one ED, urgent care, or observation care visit assigned to the post-trigger window 1 and included in episode spend (as described in section 4.4). Emergency department or observation unit visits are identified based on one of the following two ways:

- An outpatient claim detail line that is assigned to the post-trigger window 1 with an ED or observation care revenue code in the input field *Revenue Code*.
 - An outpatient, professional, or dental claim detail line that is assigned to the post-trigger window 1 with an ED, urgent care, or observation care procedure code in the input field *Detail Procedure Code*.
The configuration file lists the ED and observation care revenue and ED and observation care procedure codes under “Quality Metric 02 & 09 ED Visit Or Observation Care - Revenue Codes” and “Quality Metric 02 & 09 ED Visit Or Observation Care - Procedure Codes” respectively.
- The output field *PAP Quality Metric 02 Performance* is expressed as a percentage for each PAP based on the following ratio:
- Numerator: Number of valid episodes of the PAP where a valid episode has at least one ED or observation unit visit in the post-trigger window 1, as indicated by the *Quality Metric 02 Indicator*
 - Denominator: Number of valid episodes of the PAP

Quality metrics not tied to gain sharing for tooth extraction episode (i.e., included for information only):

■ Quality metric 3: Average MED/day during the pre-trigger opioid window

- The output field *Quality Metric 03a Indicator* is set for each episode as the average MED/day for the Pre-trigger Opioid Window among valid episodes with an Opioid Pharmacy Claim assigned to the episode window. The calculation for *Quality Metric 03a Indicator* is the same as that for the subtrahend of *Quality Metric 01a Indicator*.
- The output field *Quality Metric 03b Indicator* marks episodes with at least one Opioid Pharmacy Claim assigned to the episode window. Assignment to the episode window is detailed in section 4.2.
- The output field *PAP Quality Metric 03 Performance* is expressed in units of MEDs for each Quarterback based on the following ratio:
 - Numerator: Sum of *Quality Metric 03a Indicator* (average MED/day/episode during the Pre-trigger Opioid Window) across valid episodes of the *PAP ID* with at least one Opioid Pharmacy Claim during the episode window

- Denominator: Number of valid episodes of the *PAP ID* with at least one Opioid Pharmacy Claim during the episode window as indicated by the *Quality Metric 03b Indicator*
- **Quality metric 4: Average MED/day during the post-trigger opioid window**
 - The output field *Quality Metric 04a Indicator* is set for each episode as the average MED/day for the Post-trigger Opioid Window among valid episodes with an Opioid Pharmacy Claim assigned to the episode window. The calculation for *Quality Metric 04a Indicator* is the same as that for the minuend of *Quality Metric 01a Indicator*.
 - The output field *Quality Metric 04b Indicator* marks episodes with at least one Opioid Pharmacy Claim assigned to the episode window. Assignment to the episode window is detailed in section 4.2.
 - The output field *PAP Quality Metric 04 Performance* is expressed in units of MEDs for each Quarterback based on the following ratio:
 - Numerator: Sum of *Quality Metric 04a Indicator* (average MED/day/episode during the Post-trigger Opioid Window) across valid episodes of the *PAP ID* with at least one Opioid Pharmacy Claim during the episode window
 - Denominator: Number of valid episodes of the *PAP ID* with at least one Opioid Pharmacy Claim during the episode window as indicated by the *Quality Metric 04b Indicator*
- **Quality metric 5: New-opioids prescription (fill) rate**
 - The output field *Quality Metric 05a Indicator* marks valid episodes where the patient receives opioids during the trigger window, post-trigger window 1, or post-trigger window 2 and no opioids in the 90 days before the trigger window.
 - The output field *Quality Metric 05b Indicator* marks valid episodes where the patient has not received an opioid in the 90 days before the trigger window.
 - Opioids are identified based on pharmacy claims that are assigned to the trigger window, post-trigger window 1, post-trigger window 2, or 90 days prior to the trigger and have a code indicating an opioid prescription in the input field *National Drug Code*. A claim is in the 1 to 90 days prior to the trigger window if the difference between the input field *Detail From*

Date Of Service (for the professional, dental, or outpatient claims) and the input field *Detail From Date Of Service* of the trigger claim is between 1 and 90 days. Codes indicating an opioid prescription are identified based on Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank listed in the configuration file under “Quality Metric 05 Opioids”. To search for included medications, HIC3 codes must be crosswalked to National Drug Codes (NDCs). Since NDCs change over time an updated crosswalk including current and historical NDCs must be used for each reporting period.

- The output field *PAP Quality Metric 05 Performance* is expressed as a ratio for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP where an episode has opioids filled in the trigger window, post-trigger window 1, or post-trigger window 2 and no opioids filled in the 90 days prior to the trigger window, as indicated by the *Quality Metric 05a Indicator*
 - Denominator: Number of valid episodes of the PAP where an episode has no opioids filled in the 90 days prior to the trigger window, as indicated by the *Quality Metric 05b Indicator*

■ **Quality metric 6 : Time to extraction within 30 days**

- The output field *Quality Metric 06 Indicator* marks valid episodes that meet both of the following two conditions:
 - A dental, professional, or outpatient claim detail line with a CDT procedure code for a dental E&M visit in the input field *Detail Procedure Code* assigned to the pre-trigger window 1 or the trigger window, AND
 - No dental, professional, or outpatient claim detail line with a CDT procedure code for a dental E&M visit in the input field *Detail Procedure Code* during the 31 to 90 days prior to the trigger start date.

A dental E&M visit is listed in the configuration file under “Quality Metric 06 Dental E&M Visits”. A claim is in the 31 to 90 days prior to the trigger window if the difference between the input field *Detail From Date of Service* (for the professional, dental, or outpatient claim) and the output field *Trigger Window Start Date* is between 31 and 90 days.

- The output field *PAP Quality Metric 06 Performance* is expressed as a percentage for each PAP based on the following ratio:

- Numerator: Number of valid episodes of the PAP where an episode has a dental E&M code in the pre-trigger window 1 or the trigger window and no dental E&M code in the 31 to 90 days prior to the trigger start date, as indicated by the *Quality Metric 06 Indicator*
- Denominator: Number of valid episodes of the PAP

■ **Quality metric 7: Preventive services rate**

- The output field *Quality Metric 07 Indicator* marks valid episodes that have at least one preventive service in the 365 days prior to the episode start. Preventive services are identified based on dental, professional, or outpatient claim detail lines with a CDT procedure code for a preventive service (e.g., prophylaxis, smoking cessation counseling) in the input field *Detail Procedure Code*. The configuration file lists the procedure codes for preventive services under “Quality Metric 07 Preventive Services”. A claim is in the 365 days prior to the episode window if the difference between the input field *Detail From Date Of Service* (for the professional, dental, or outpatient claims) and the output field *Episode Start Date* is 365 days or less.
- The output field *PAP Quality Metric 07 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP where an episode has at least one preventive service is in the 365 days prior to the episode start, as indicated by the *Quality Metric 07 Indicator*
 - Number of valid episodes of the PAP

■ **Quality metric 8: General anesthesia rate for patients age 5 years or less**

- The output field *Quality Metric 08a Indicator* marks valid episodes for patients with the output field *Member Age* between 0 to 5 years of age that have dental, professional, or outpatient claim detail lines assigned to the trigger window with a CPT or CDT procedure code for general anesthesia in the input field *Detail Procedure Code*. The procedure codes for general anesthesia are listed in the configuration file under “Quality Metric 08 General Anesthesia”. For the definition of Member Age refer to the glossary.
- The output field *Quality Metric 08b Indicator* marks valid episodes for patients with the output field *Member Age* between 0 to 5 years of age. For the definition of Member Age refer to the glossary.

- The output field *PAP Quality Metric 08 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP where an episode has a Member Age under 5 years of age and has a procedure code general anesthesia in the trigger window, as indicated by the *Quality Metric 08a Indicator*
 - Denominator: Number of valid episodes of the PAP where an episode has a Member Age under 5 years of age, as indicated by the *Quality Metric 08b Indicator*

■ **Quality metric 9: Pre-trigger ED visits for known patients**

- The output field *Quality Metric 09a Indicator* marks valid episodes that have an ED, urgent care, or observation care visits in the pre-trigger windows for known patients. Known patients are identified as patients who have received dental care from the principal accountable provider in the 365 days prior to the episode start date. The claims are identified if they meet both of the following conditions:
 - An ED, urgent care, or observation care visit that is assigned to the pre-trigger window 1 or pre-trigger window 2 is identified in one of the two following ways:
 - An outpatient claim detail line with an ED or observation care revenue code in the input field *Revenue Code* and a related diagnosis in the field *Header Diagnosis Code Primary*. The revenue codes for ED or observation care are listed in the configuration file under “Quality Metric 02 & 09 ED Visit Or Observation Care - Revenue Codes”. The diagnosis codes for related diagnoses are listed in the configuration file under “Included Relevant Diagnoses”.
 - An outpatient, professional, or dental claim detail line with an ED, urgent care, or observation care procedure code in the input field *Detail Procedure Code* and a related diagnosis in the field *Header Diagnosis Code Primary*. The procedure codes for ED or observation care are listed in the configuration file under “Quality Metric 02 & 09 ED Visit Or Observation Care - Procedure Codes”. The diagnosis codes for related diagnoses are listed in the configuration file under “Included Relevant Diagnoses”.

- An outpatient, dental, or professional claim detail line with a CDT or CPT procedure code for a dental procedure in the input field *Detail Procedure Code* performed by the PAP in the 365 days prior to the episode start. The configuration file lists the dental procedure codes under “Quality Metric 09 Dental Procedures”. The procedure was performed by the PAP if the input field *Billing Provider ID* of the claim that includes the dental procedure is the same as the output field *PAPID*. A claim is in the 365 days before the episode start date if the difference between the input field *Detail From Date Of Service* and the output field *Episode Start Date* is between 1 and 365 days.
- The output field *Quality Metric 09b Indicator* marks valid episodes that have an outpatient, dental, or professional claim detail line with a CDT or CPT procedure code for a dental procedure in the input field *Detail Procedure Code* performed by the PAP in the 365 days prior to the episode start. The configuration file lists the dental procedure codes under “Quality Metric 09 Dental Procedures”. The procedure was performed by the PAP if the input field *Billing Provider ID* of the claim that includes the dental procedure is the same as the output field *PAPID*. A claim is in the 365 days before the episode start date if the difference between the input field *Detail From Date Of Service* and the output field *Episode Start Date* is between 1 and 365 days.
- The output field *PAP Quality Metric 09 Performance* is expressed as a percentage for each PAP based on the following ratio:
 - Numerator: Number of valid episodes of the PAP where the episode has an ED visit in the pre-trigger window 1 or pre-trigger window 2 and a dental procedure by the PAP in the 365 days prior to the episode start, as indicated by the *Quality Metric 09a Indicator*
 - Denominator: Number of valid episodes of the PAP where the episode has a dental procedure by the PAP in the 365 days prior to the episode start, as indicated by the *Quality Metric 09b Indicator*

4.8 Perform risk adjustment

The eighth design dimension of building a tooth extraction episode is to risk adjust the non-risk-adjusted episode spend for risk factors that may contribute to higher episode spend given the characteristics of a patient.

Episode output fields created: *Risk Factor <risk factor number>*, *Episode Risk Score*, *Risk-adjusted Episode Spend*

PAP output fields created: *Average Risk-adjusted PAP Spend*, *Total Risk-adjusted PAP Spend*

Risk adjustment first requires identification of the risk factors that affect each episode. Then the *Non-risk-adjusted Episode Spend* is multiplied by the risk score that applies to the episode given its risk factors. The derivation of the risk factors and their coefficients is not part of the algorithm to produce an episode and is therefore not described in the DBR.

Flag episodes that are affected by risk factors: The following types of risk factors apply:

- Age-based risk factors: The output fields *Risk Factor <risk factor number>* for age-based risk factors indicate whether the *Member Age* of the patient falls into the age range specified for the risk factor. The relevant age ranges are listed as parameters in the configuration file under “Risk Adjustment”. For the definition of *Member Age* see the glossary.
- Diagnosis-based risk factors: The output fields *Risk Factor <risk factor number>* for diagnosis-based risk factors indicate whether an inpatient, outpatient, dental, or professional claim that is assigned to the specified time window contains a risk factor diagnosis code in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The risk factor diagnoses codes and the time windows are listed in the configuration file under “Risk Factors <risk factor number and name>”.
- CCS category-based risk factors: The output fields *Risk Factor <risk factor number>* for CCS category-based risk factors indicate whether an inpatient, outpatient, dental, or professional claim that is assigned to the specified time window contains a risk factor diagnosis code associated with the CCS code(s) in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. CCS codes are converted into ICD-9 and ICD-10 diagnoses codes using the definition of the single/multi-level CCS categories (as indicated in the configuration file) for ICD-9 and ICD-10 diagnoses codes available from AHRQ (<http://www.hcup-us.ahrq.gov/toolssoftware/ccs/ccs.jsp>). The configuration file lists the codes and time windows used under “Risk Factors <risk factor number and name>”.

- CCS category and diagnosis-based risk factors: The output fields *Risk Factor <risk factor number>* for CCS category and diagnosis-based risk factors indicate whether the following is true:
 - There is evidence for the risk factor diagnosis in the specified time window, as identified by either:
 - An inpatient, outpatient, dental, or professional claim that is assigned to the specified time window and contains a risk factor diagnosis code associated with the CCS code(s) in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. CCS codes are converted into ICD-9 and ICD-10 diagnoses codes using the definition of the multi-level CCS categories for ICD-9 and ICD-10 diagnoses codes as described above. The configuration file lists the codes and time windows used under “Risk Factors <risk factor number and name>”.
 - An inpatient, outpatient, dental, or professional claim that is assigned to the specified time window and contains a risk factor diagnosis code in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The risk factor diagnoses codes and the time windows are listed in the configuration file under “Risk Factors <risk factor number and name>”.
- Procedure-based risk factors: The output fields *Risk Factor <risk factor number>* for procedure-based risk factors indicate whether an inpatient, dental, outpatient, or professional claim that is assigned to the specified time window contains a risk factor procedure code in the input field *Detail Procedure Code*. The risk factor procedure codes and the time windows are listed in the configuration file under “Risk Factors <risk factor number and name>”.
- Multiple extractions as risk factors: The output fields “*Risk Factor 028*”, “*Risk Factor 029*”, “*Risk Factor 030*”, and “*Risk Factor 031*” are for multiple extractions-based risk factors and indicate whether the number of tooth extractions for the patient falls into the range specified for the risk factor. The relevant ranges are listed as parameters in the configuration file under “Risk Adjustment”. The number of extractions for an individual episode is determined by the count of dental claim detail lines assigned to either the trigger window or post-trigger window 1 that meet both of the following two conditions:

- Have a CDT code for tooth extraction in the input field *Detail Procedure Code*. The procedure codes for tooth extraction are listed under “Trigger Procedure Codes” in the configuration file, AND
 - Have a code for tooth number in the input field *Tooth Number*. The codes for tooth numbers are listed under “Tooth Number Codes” in the configuration file.
- Wisdom teeth removal as a risk factor: The output fields *Risk Factor <risk factor number>* for wisdom teeth removal based-risk factors indicate whether the patient underwent a wisdom teeth removal with a specific surgical tooth extraction procedure. The wisdom teeth removal based-risk factors and the time windows are listed in the configuration file under “Risk Factors <risk factor number and name>”. Claims for these risk factors are determined by dental claim detail lines that are assigned to the trigger or the post-trigger window 1 that meet the following two conditions:
 - Have a CDT code for surgical tooth extraction in the input field *Detail Procedure Code*, AND
 - Have a code for wisdom teeth in the input field *Tooth Number*. The codes for tooth numbers are listed under “Wisdom Teeth Codes” in the configuration file.
 - Non-wisdom teeth removal as a risk factor: The output fields *Risk Factor <risk factor number>* for non-wisdom teeth removal based-risk factors indicate whether the patient underwent a non-wisdom teeth removal with a specific surgical tooth extraction procedure. The non-wisdom teeth removal based-risk factors and the time windows are listed in the configuration file under “Risk Factors <risk factor number and name>”. Claims for these risk factors are determined by dental claim detail lines that are assigned to the trigger or the post-trigger window 1 that meet the following two conditions:
 - Have a CDT code for surgical tooth extraction in the input field *Detail Procedure Code*, AND
 - Have a code for non-wisdom teeth in the input field *Tooth Number*. The codes for tooth numbers are listed under “Non-wisdom Teeth Codes” in the configuration file.

The claims that are searched for risk factors do not have to be included claims. If a patient was not continuously enrolled during the year before the episode window or during the episode window, risk factors are searched for in the claims available.

Calculate the episode risk score: Each risk factor is associated with a risk coefficient, the values for which are listed as parameters in the configuration file under “Risk Adjustment.” The sum of all the risk coefficients for factors present in a given episode plus the *Average Risk Neutral Episode Spend* is the predicted spend of the episode. The configuration file lists the *Average Risk Neutral Episode Spend* as a parameter under “Risk Adjustment.” For the episode, the *Episode Risk Score* for an episode is the ratio of the *Average Risk Neutral Episode Spend* to the predicted spend of the episode. For example, if an episode is affected by two risk factors, *Risk Factor 001* and *Risk Factor 002*, the *Episode Risk Score* is:

$$\text{Episode Risk Score} = \frac{\text{Average Risk Neutral Episode Spend}}{\text{Average Risk Neutral Episode Spend} + \text{Risk Coefficient 001} + \text{Risk Coefficient 002}}$$

If an episode is not affected by any risk factors, the *Episode Risk Score* is equal to one (1).

Calculate risk-adjusted episode spend: To calculate the episode output field *Risk-adjusted Episode Spend*, the *Non-risk-adjusted Episode Spend* is multiplied by the *Episode Risk Score*.

$$\text{Risk-adjusted Episode Spend} = \text{Non-risk-adjusted Episode Spend} * \text{Episode Risk Score}$$

The PAP output field *Average Risk-adjusted PAP Spend* is calculated as the average of the *Risk-adjusted Episode Spend* across valid episodes of each PAP. The *Total Risk-adjusted PAP Spend* is calculated as the sum of the *Risk-adjusted Episode Spend* across valid episodes of each PAP.

4.9 Calculate gain/risk sharing amounts

The ninth and final design dimension of building an HIV episode is to calculate the gain or risk sharing amount for each PAP. The description below outlines one possible approach of linking PAP performance to payments. The State of Ohio may choose to provide further guidance at a future point in time when gain/risk sharing payments will be implemented.

PAP output fields created: *Count Of Total Episodes Per PAP, Count Of Valid Episodes Per PAP, Minimum Episode Volume Pass, Gain Sharing Quality Metric Pass, Gain/Risk Sharing Amount, PAP Sharing Level*

Gain and risk sharing amounts are calculated based on the episodes of each PAP that end during the reporting period. The State's proposed approach to calculating the gain or risk sharing amount paid to/by each PAP uses the following pieces of information:

- **Number of episodes of each PAP:** The output field *Count Of Total Episodes Per PAP* is defined as the number of total episodes each PAP treats during the reporting period. The output field *Count Of Valid Episodes Per PAP* is defined as the number of valid episodes each PAP treats during the reporting period. Episodes are counted separately by each payer. For the provider reports the field *Count Of Valid Episodes Per PAP* is also shown broken out by the number of valid episodes with spend of each claim type (*Count Of Valid Episodes Per PAP With Inpatient/With Outpatient/With Professional/With Pharmacy/Dental*). To calculate the breakouts, the number of valid episodes of each PAP are counted that have greater than zero dollars (>\$0) in *Non-risk-adjusted Episode Spend* for a given claim type.
- **Minimum episode requirement:** Only PAPs who pass the minimum episode requirement of five or more (≥ 5) valid episodes receive a provider report and are eligible for gain and risk sharing. The output field *Minimum Episode Volume Pass* is set to indicate whether a PAP has five or more valid episodes during the reporting period. Whether a PAP passes the minimum episode requirement is determined independently by each payer based on the episodes a PAP has for patients enrolled with the payer. The assignment of episodes to a payer is detailed in the glossary under payer attribution.
- **Performance of each PAP on quality metrics tied to gain sharing:** Only PAPs who pass the quality metrics tied to gain sharing are eligible for gain sharing. The thresholds to pass the quality metrics are set in accordance with the definition of each quality metric and are provided as input parameters for the episode algorithm. The output field *Gain Sharing Quality Metric Pass* indicates whether a PAP passes all quality metrics tied to gain sharing.
- **Commendable Threshold, Acceptable Threshold, and Gain Sharing Limit Threshold:** The thresholds are set based on the historical performance of

PAPs with five or more episodes. The values for the thresholds are provided as input parameters for the episode algorithm.

- *Gain Share Proportion* and *Risk Share Proportion*: The split of the gains and losses in the episode-based payment model between payer and provider is at the discretion of each payer. The proportions are provided as input parameters for the episode algorithm.

Gain sharing payment: To receive a gain sharing payment, a PAP must meet all of the following three criteria:

- Pass the quality metrics thresholds tied to gain sharing
- Pass the minimum episode requirement,
- Have an *Average Risk-adjusted PAP Spend* below (<) the *Commendable Threshold* and have an *Average Risk-adjusted PAP Spend* above or equal to (>=) the *Gain sharing limit*.

If the three conditions are met, the *Gain/Risk Sharing Amount* is set based on the following formula:

$$[Gain/Risk Sharing Amount] = \frac{[Total Non-risk-adjusted PAP Spend] \times [Gain Share Proportion] \times ([Commendable Threshold] - [Average Risk-adjusted PAP Spend])}{[Average Risk-adjusted PAP Spend]}$$

Risk sharing payment: To owe a risk-sharing payment, a PAP must meet both of the following criteria:

- Pass the minimum episode requirement
- Have an *Average Risk-adjusted PAP Spend* above or equal to (>=) the *Acceptable Threshold*.

The risk-sharing payment applies irrespective of the performance of the PAP on the quality metrics. If the above two conditions are met, the *Gain/Risk Sharing Amount* is set based on the following formula:

$$[Gain/Risk Sharing Amount] = \frac{[Total Non-risk adjusted PAP Spend] \times [Risk Share Proportion] \times ([Acceptable Threshold] - [Average Risk-adjusted PAP Spend])}{[Average Risk-adjusted PAP Spend]}$$

If neither the conditions for a gain sharing payment nor a risk sharing payment are met, the output field *Gain/Risk Sharing Amount* is set to zero dollars ('\$0').

To summarize the performance of each PAP in the episode-based payment model the output field *PAP Sharing Level* is set to

- “1” if *Average Risk-adjusted PAP Spend* < *Gain Sharing Limit Threshold*
- “2” if *Average Risk-adjusted PAP Spend* < *Commendable Threshold* and also \geq *Gain Sharing Limit Threshold*
- “3” if *Average Risk-adjusted PAP Spend* \leq *Acceptable Threshold* and also \geq *Commendable Threshold*
- “4” if *Average Risk-adjusted PAP Spend* > *Acceptable Threshold*

Beginning in the 2019 program year: The risk and gain share amount assessed at the all payer level for a PAP, will be split among the payers using a methodology based on volume and risk. Each payer is attributed a portion of the risk or gain share based on the ratio of their risk adjusted valid episodes to total risk adjusted episodes. Where risk adjusted episodes are the number of episodes attributed to the payer for a PAP divided by the payer risk adjusted ratio for that PAP.

*** End of algorithm ***

5. GLOSSARY

- **Claim types:** The claim types used in the tooth extraction episode are based on the input field *Claim Type*. The required claim types are:
 - Inpatient (I)
 - Outpatient (O)
 - Dental (D)
 - Long-term care (L)
 - Pharmacy (P)
 - Professional (M)

Note that the State of Ohio Department of Medicaid defines long-term care claims based on the input field *Type of Bill* values beginning with 21, 22, 23, 28, 65, and 66.

- **Clean period:** See section 2.3.1
- **CDT:** Current Dental Terminology
- **CPT:** Current Procedural Terminology
- **DBR:** Detailed Business Requirements
- **Duration of time windows:** The duration of a time window (e.g., the episode window, the trigger window), the duration of a claim or claim detail line, and the length of stay for inpatient stays is calculated as the last date minus the first date plus one (1). For example:
 - A trigger window with a *Trigger Window Start Date* of January 1, 2014 and a *Trigger Window End Date* of January 1, 2014 has a duration of one (1) day.
 - A trigger window with a *Trigger Window Start Date* of January 1, 2014 and a *Trigger Window End Date* of January 3, 2014 has a duration of three (3) days.
 - A claim with a *Header From Date Of Service* of January 1, 2014 and a *Header To Date of Service* of January 2, 2014 has a duration of two (2) days.
- **Episode window:** See section 4.2
- **FFS:** Fee For Service

- **HCPCS:** Healthcare Common Procedure Coding System
- **HIC3:** Hierarchical Ingredient Code at the third level based on the classification system by First Databank
- **Hospitalization:** A hospitalization is defined as all the inpatient claims a patient incurs while being continuously hospitalized in one inpatient facility. A hospitalization may include more than one inpatient claim because the inpatient facility may file interim inpatient claims. A hospitalization consisting of just one inpatient claim starts on the *Header From Date Of Service* and ends on the *Discharge Date* of the inpatient claim. A hospitalization where two or more inpatient claims are linked together starts on the *Header From Date Of Service* of the first inpatient claim and ends on the *Discharge Date* of the last inpatient claim in the hospitalization. Within the DBR, the start of a hospitalization is referred to as the *Header From Date Of Service* for that hospitalization and the end of the hospitalization is referred to as the *Discharge Date* of that hospitalization.

Inpatient claims are linked together into one hospitalization consisting of two or more inpatient claims if any of the following conditions apply:

- Interim billing or reserved/missing discharge status: An inpatient claim with a *Patient Status Indicator* that indicates interim billing (see the configuration file under “Hospitalization - Interim Billing” for the codes used), that is reserved (see the configuration file under “Hospitalization - Reserved” for the codes used), or that is missing is linked with a second inpatient claim into one hospitalization if either of the following conditions apply:
 - There is a second inpatient claim with a *Header From Date Of Service* on the same day as or the day after the *Discharge Date* of the first inpatient claim
 - There is a second inpatient claim with an *Admission Date* on the same day as the *Admit Date* of the first inpatient claim and also a *Header From Date Of Service* on the same day as or within thirty (≤ 30) days after the *Discharge Date* of the first inpatient claim
- If the second inpatient claim (and potentially third, fourth, etc.) also has a *Patient Status Indicator* indicating interim billing, reserved, missing, or transfer the hospitalization is extended further until an inpatient claim with a discharge status other than interim billing, reserved, missing, or

transfer occurs, or until the inpatient claim that follows does not satisfy the required conditions.

- **Transfer:** An inpatient claim with a *Patient Status Indicator* indicating a transfer (see the configuration file under “Hospitalization - Transfer” for the codes used) is not linked with the second inpatient claim. The second inpatient claim yields a separate hospitalization with a *Header From Date Of Service* on the same day as or the day after the *Discharge Date* of the first inpatient claim.

- **ICD-9:** International Classification of Diseases, Ninth Revision
- **ICD-10:** International Classification of Diseases, Tenth Revision
- **ICN:** Internal Control Number
- **Length of stay:** See glossary entry Duration of time windows.
- **MCP:** Managed Care Plan
- **Member Age:** The output field *Member Age* reflects the patient’s age in years at the episode trigger. *Member Age* is calculated as the difference in years between the start of the claim that is used to set the *Trigger Claim ID* and the date of birth of the patient. The start of the claim is determined using the input field *Header From Date Of Service* for inpatient claims and the earliest *Detail From Date Of Service* across all claim detail lines for outpatient, dental, and professional claims. The date of birth of the patient is identified by linking the *Member ID* of the patient in the episode output table to the *Member ID* of the patient in the Member Extract and looking up the date in the input field *Date of Birth*. *Member Age* is always rounded down to the full year. For example, if a patient is 20 years and 11-months old at the start of the episode, the *Member Age* is set to 20 years. If the *Date of Birth* is missing, greater than (>) 100 years, or less than (<) 0 years, then the output field *Member Age* is treated as invalid.
- **NDC:** National Drug Code
- **PAP:** Principal Accountable Provider
- **Patient:** An individual with a tooth extraction episode
- **Payer attribution:** Patients may be enrolled with Ohio Medicaid Fee For Service or with a Managed Care Plan. An episode is attributed to a payer using the input field *MCP ID* with the highest number of visits included in

the episode spend that have the input field *Billing Provider ID* matching the output field *PAP ID*.

If two or more payers are tied based on the number of visits, the following hierarchy is applied:

- Among payers that are tied, the input field *MCP ID* with the highest amount of spend across included claims is the payer of the episode.
 - Among payers that are still tied, the input fields *MCP ID* with the visit that starts closest to the output field *Episode End Date* is the payer attributed to the episode. The visit must be included in episode spend.
 - Among payers that are still tied, the first payer in alphabetical order in the input field *MCP ID* is the payer of the episode.
- **Post-trigger window 1:** See section 4.2
 - **Post-trigger window 2:** See section 4.2
 - **Pre-trigger window 1:** See section 4.2
 - **Pre-trigger window 2:** See section 4.2
 - **Trigger window:** See section 4.2
 - **Total episodes:** All episodes, valid plus invalid.
 - **Valid episodes:** See section 4.6
 - **Visit:** A visit is defined as all claim detail lines of professional claims with the same detail line start date.

The duration of a visit is defined as the detail line start date to the maximum detail line end date of detail lines that are part of the visit.
