Overview of the femur and pelvis fracture episode of care

State of Ohio

March 2018
Overview of the femur and pelvis fracture episode of care

1. CLINICAL OVERVIEW AND RATIONALE FOR DEVELOPMENT OF THE FEMUR AND PELVIS FRACTURE EPISODE

1.1 Rationale for development of the femur and pelvis fracture episode of care

Femur and pelvis fractures can be the result of high-energy traumatic fractures (e.g., sports injuries among teenagers), low-energy traumatic fractures (e.g., minor falls in elderly patients with osteoporosis), and stress fractures resulting from repetitive overload.\(^1\) Surgery on the femoral head and neck, femoral shaft, or pelvis (acetabular and non-acetabular) is one modality to treat specific pain, associated symptoms, and restore ambulatory function. Broadly, femoral head and neck fractures are the most common type (relative to femoral shaft and pelvis fractures) and occur in approximately 325,000 patients in the U.S. each year.\(^2\) They are most prevalent in the elderly, largely resulting from low-energy incidents like falls. Pelvis fractures are the next most common and occur in about 65,000 patients a year typically due to low-energy events.\(^3\) Femoral shaft fractures are the least common, occurring in about 30,000 patients a year primarily due to high-energy collisions such as motor vehicle accidents.\(^4\) From October 2014 to September 2015, Ohio Medicaid beneficiaries between 0-64 years of age received over 2,200 such femur and pelvis fracture procedures.\(^5\) This represents approximately $45.1 million in spend, with a median cost of $15,200 per episode.

---

1 Severe trauma patients, as defined by multi-system trauma (e.g., concurrent hip and rib fractures), are excluded from this episode.
5 Analysis of Ohio Medicaid claims data for episodes ending between October 1, 2014 and September 30, 2015.
There are many opportunities to improve guideline-concordant care in order to support optimal patient outcomes. For example, evidence-based clinical guidelines of the American Academy of Orthopaedic Surgeons (AAOS) outline best practices for clinicians to improve quality of care and outcomes for patients. During the perioperative window, use of preoperative regional anesthesia can improve pain control and can reduce incidence of postoperative delirium.\(^6\) After discharge from the hospital, patients should undergo physical therapy and nutritional supplementation to improve functional outcomes, prevent falls, and reduce mortality.

Despite these clinical guidelines, surgical and treatment practices during the operative and perioperative periods of a femur or pelvis surgery following a fracture vary widely from one provider to another. Unique patient needs will necessitate a certain level of variation in surgical and treatment practice; however, practice variation due to reasons not related to the patient may lead to poor patient outcomes, unnecessary costs to the system, or both.

The femur and pelvis fracture episode will complement other orthopedic episodes (e.g., total joint replacement) and Ohio’s Comprehensive Primary Care (CPC) program to help reduce unnecessary practice variation and incentivize evidence-based care. Within the CPC program, providers may help to manage osteoporosis while in the episodes program orthopedic surgeons may minimize procedural and other complications during the operative and post-operative periods. For example, the CPC program quality metrics encourage initiation of alcohol and drug dependence treatments,\(^7\) while quality and utilization metrics in the orthopedic episodes encourage providers to minimize unnecessary opioid prescriptions.

### 1.2 Clinical overview and typical patient journey for the femur and pelvis fracture episode

For this episode, femur and pelvis fracture surgery refers to various surgical procedures that are performed to alleviate pain and prevent morbidity and mortality caused by high-energy events such as a sports collision and low-energy events such as a minor fall. Patients with severe trauma, for example, as represented by concurrent pelvic and rib fractures, are excluded from this episode because of the

---

\(^7\) See, for example, the inclusion of the metric “Initiation of alcohol and other drug dependence treatment” in the quality metrics of the CPC program. Available at [http://www.medicaid.ohio.gov/Portals/0/Providers/PaymentInnovation/CPC/qualityMetricSpecs.pdf](http://www.medicaid.ohio.gov/Portals/0/Providers/PaymentInnovation/CPC/qualityMetricSpecs.pdf). Accessed on December 11, 2017.
greater complexity of injury relative to other fracture types. Common procedures for femur and pelvis fractures include closed reduction and percutaneous fixation, open reduction and internal fixation, and arthroplasty. These procedures are done for common diagnoses such as femoral head and neck, femoral shaft, and pelvis fractures.

Femur and pelvis fracture procedures are surgical procedures intended to stabilize the fractured region through use of orthopedic hardware (e.g., pins, screws, nails). In some cases, treatment may result in a partial or total hip replacement. For femoral head / neck fractures, either open reduction with internal fixation or arthroplasty are typically performed. Femoral shaft fracture patients will receive intramedullary nailing. Pelvis fracture patients will receive open reduction with internal fixation, utilizing plates and screws.

As depicted in Exhibit 1, the patient journey begins when a patient experiences signs and symptoms of a femur or pelvis fracture (e.g., pain, bruising, and swelling). The patient may present to one of a range of providers (e.g., orthopedist, emergency medical services) and then most often then referred to the emergency department for stabilization. In the emergency department, the patient will receive pain medications and imaging (e.g., x-ray) prior to being admitted and stabilized before the appropriate operation on the fracture site. During the procedure, anesthesia is administered and the surgery is performed. Screws, nails, or other hardware may be placed to stabilize the fracture site. After the surgery, the patient is typically monitored for a short period of time for immediate post-operative complications and is counseled on the post-procedure treatment plan. After discharge, the patient should receive post-surgical follow-up care, including follow-up visits with the clinical team. The patient may also undergo physical therapy and require follow-up imaging to assess post-operative status of the fracture site. Pain management may be necessary, including the prescription of analgesics.

Patients may develop complications both during the procedure and afterwards. Potential complications include infection of the surgical site, persistent bleeding, continuation of pain, and other procedural complications.
EXHIBIT 1 – FEMUR AND PELVIS FRACTURE PATIENT JOURNEY

1. Acute presentation
   Outside of care setting
   - Patient experiences signs and symptoms of a femur or pelvis fracture
   - Patient may contact emergency medical services, PCP, orthopedist, and/or other providers. The patient will be referred to the emergency department (ED) if they do not initially present there

2. Assessment
   Emergency Department
   - Patient is stabilized and has history and physical exam taken
   - Patient receives pain control and imaging (e.g., x-ray, MRI, CT) to assess the potential fracture
   - Patient may be admitted for ongoing treatment

3. Procedure
   ED/Observation or inpatient
   - Patient is prepared for procedure (pre-op pulmonary/cardiac assessments if necessary and given appropriate levels of anesthesia)
   - Procedure will vary based on if fracture is femoral shaft, femoral neck, or pelvis
   - Certain cases of femoral head fracture procedures may merit partial hip replacement1
   - Patient may receive closed reduction and percutaneous fixation or open reduction and internal fixation

4. Follow-up care
   Home, office, outpatient hospital, IRF, SNF
   - Patient has follow-up visits with the clinical team and additional imaging is taken as necessary
   - Appropriate medications prescribed for pain and other uses (e.g., controlled substances, blood thinners)
   - Patient undergoes physical therapy or receive nursing care as needed in appropriate setting

5. Potential complications
   Office, outpatient hospital, ED, or inpatient hospital
   - Surgical site infection / bleeding
   - Deep vein thrombosis
   - Pulmonary embolism
   - Continuation of pain / symptoms
   - Pneumonia

1 Partial and total hip replacements are excluded for inclusion in the total joint replacement episode.

1.3 Potential sources of value within the patient journey

Within the femur and pelvis fracture episode, providers have several opportunities to improve quality of care and reduce unnecessary spend associated with the episode (see Exhibit 2). For example, prior to the procedure providers can utilize appropriate imaging (e.g., x-ray, MRI, CT scans). During the perioperative period, physiological optimization, such as providing antibiotic prophylaxis, can decrease the wound infections and other complications after surgery. At discharge, providers can transition patients to the proper post-acute site of care based on unique patient risk factors (e.g., ability for self-care at home). Improvements in care such as these may help to reduce long term complications, restore functionality, and decrease unnecessary costs while also resolving the symptoms that led to the procedure.

EXHIBIT 2 – FEMUR AND PELVIS FRACTURE SOURCES OF VALUE

1. Acute presentation
   - Outside of care setting
     - Patient experiences signs and symptoms of a femur or pelvic fracture
     - Patient may contact emergency medical services, PCP, orthopedist, and/or other providers. The patient will be referred to the emergency department (ED) if they do not initially present there.

2. Assessment
   - Appropriate imaging and testing (e.g., only MRI or CT scans when necessary)
   - Appropriate pre-operative management (e.g., antibiotics, analgesics, limiting opioids)

3. Procedure
   - Perioperative patient risk stratification and physiological optimization (hemoglobin, sodium levels) to reduce morbidity and mortality
   - Procedure will vary based on fracture classification

4. Follow-up care
   - Discharge site of care (e.g., discharging to appropriate post-acute setting) with the clinical team and
   - Timely follow-up care with orthopedic surgeon and primary care physician
   - Resolution of symptoms and restoration of functionality
   - Post-operative management (e.g., reducing opioids, avoiding concurrent opioids and benzodiazepines)

5. Reduced direct surgical (e.g., wound infections, peri-prosthetic fractures / dislocations) and medical complications (e.g., VTE)
   - Reduced readmissions and avoidable ED / observation visits
2. OVERVIEW OF THE FEMUR AND PELVIS FRACTURE EPISODE DESIGN

2.1 Episode Trigger

The femur and pelvis fracture episode is triggered by a professional claim including a femoral head / neck, femoral shaft, or pelvis fracture procedure performed in an inpatient setting (see Table 1 for the list of triggering CPT codes, and Exhibit 3 in the Appendix for an analysis of triggers).

2.2 Principal Accountable Provider

The principal accountable provider (PAP) is the person or entity best positioned to influence the patient journey and the clinical decisions made throughout the course of the episode. For the femur and pelvis fracture episode, the PAP is the surgeon who performed the surgery. Because this provider is directly involved in the procedure, he or she is in the best position to promote adherence to guidelines, prevent complications, and influence other sources of value (see Exhibit 4 in the Appendix for the distribution of average non-risk adjusted spend by PAP).

2.3 Episode Duration

The femur and pelvis fracture episode begins with the operative procedure and associated inpatient admission (called the “trigger window”), and ends 60 days after discharge (called the “post-trigger window”). The 60-day post-discharge period is split into two “post-trigger windows”: a 30-day post-trigger window (called “post-trigger window 1”) followed by a second 30-day post-trigger window (called “post-trigger window 2”). The rationale for the split post-trigger window relates to which services are included and is described in greater detail in section 2.4.

2.4 Included Services

The episode model is designed to address spend for care and services directly related to the diagnosis, treatment, and immediate recovery phase for patients undergoing a femur or pelvis fracture procedure. Each period of the patient journey, or episode “window,” has a distinct claim inclusion logic derived from two major criteria: 1) that the type of included care and services must correspond to that period of the patient journey and 2) that the included care and services are understood to be directly or indirectly influenced by the PAP during that period.
The femur and pelvis fracture episodes are each comprised of three distinct windows for the purpose of spend inclusions: a trigger window, a post-trigger window 1, and a post-trigger window 2. Inclusions in the different episode windows are as follows:

- **Trigger window** (when the procedure and associated admission occurs): the hospital stay and all medical care is included as are related medications.
- **Post-trigger window 1** (one through 30 days following initial discharge): immediate post-operative complications (e.g., surgical site infection, bleeding), related follow-up care (e.g., office or clinic follow-up visits, physical therapy), opioid prescriptions, skilled nursing home facility stays, and repeat procedures are included.
- **Post-trigger window 2** (31 through 60 days following initial discharge): opioid prescriptions and repeat procedures are included.

The total episode spend is calculated by adding up the spend amounts on all of the individual claims that were included in the episode window.

### 2.5 Episode Exclusions and Risk Factors

To ensure that episodes are comparable across patient panels, select risk factors and exclusions are applied before assessing PAP performance. Risk factors are applied to episodes to make spend more comparable across different patient severities, while episode exclusions are applied when a clinical factor deems the patient too severe (and too high spend) for risk adjustment to be possible.

In the context of episode design, risk factors are attributes (e.g., age) or underlying clinical conditions (e.g., heart conditions) that are likely to impact a patient’s course of care and the spend associated with a given episode. Risk factors are selected via a standardized and iterative risk-adjustment process which gives due consideration to clinical relevance, statistical significance, and other contextual factors. Based on the selected risk factors, each episode is assigned a risk score. The total episode spend and the risk score are used to arrive at an adjusted episode spend. This value is used to calculate a provider’s average risk-adjusted spend across all episodes, which is the measure across which providers are compared to each other. Table 2 in the Appendix lists the risk factors and Exhibit 5 presents an analysis of these risk factors.

---

By contrast, an episode is excluded from a patient panel when the patient has clinical factors that suggest he or she has experienced a distinct or different journey indicative of significant increases in spend relative to the average patient. In addition, there are several “business-related” exclusions regarding reimbursement policy (e.g., whether a patient sought care out of state), the completeness of spend data for that patient (e.g., third-party liability or dual eligibility), and other topics relating to episode design and implementation, such as overlapping episodes, during the comparison period. Episodes with no exclusions are known as “valid” and used for provider comparisons. Episodes that have one of any of the exclusions are known as “invalid” episodes.

For the femur and pelvis fracture episode, both clinical and business exclusions apply. Several of the business exclusions (e.g., dual Medicare and Medicaid eligibility, patient left against medical advice) are standard across most episodes while clinical exclusions relate to the scope of the episode design. The list of business and clinical exclusions is included in Table 3, and Exhibit 6 presents an analysis of these exclusions in the Appendix.

### 2.6 Quality and Utilization Metrics

To ensure the episode model incentivizes quality care, the femur and pelvis fracture episode has six quality and utilization metrics. Two are linked to performance assessment, meaning that performance thresholds on these must be met in order for PAP to be eligible for positive incentive. The specific threshold amount will be determined during the informational reporting period. Three of the quality and utilization metrics are for informational purposes only.

The metrics tied to positive incentive payments are rate of follow up care during the first post-trigger window and the average difference in morphine equivalent dose (MED)/day of all opioid prescriptions between the post-trigger opioid window and the pre-trigger opioid window. Informational metrics include the average MED/day during the 1-60 days prior to the trigger window (the pre-trigger opioid window), the average MED/day in days 31-60 after the trigger window (the post-trigger opioid window), the percentage of valid episodes with a related readmission, the percentage of valid episodes with a related ED or observation visit in the first post-trigger window, the percentage of valid episodes with a surgical complication in the first post-trigger window, and the percentage of valid episodes that are discharged to a post-acute care setting after the index admission.

The three opioid metrics above, which are standard across many episodes (orthopedic and other), aim to: 1) raise awareness of prescribing patterns of the PAP and other prescribers; 2) assist in identifying opioid patients at higher risk for misuse.
A complete list of quality and utilization metrics is provided in Table 4, and Exhibit 7 presents an analysis of these quality and utilization metrics in the Appendix.

EXHIBIT 7 – PAP PERFORMANCE ON EPISODE QUALITY AND UTILIZATION METRICS

1. For valid episodes (222) across valid PAPs (22); valid episodes do not include episodes with business (e.g., third-party liability, dual eligibility) or clinical exclusions (e.g., total hip replacement); valid PAPs are physicians with five or more. Valid episodes for invalid PAPs (those with less than five valid episodes) are not included in this analysis.
