

**Wound Care Certification Grant
Final Report to Ohio Department of Medicaid**

March 2018

Introduction.

This report reviews the wound care certification grant that the Ohio Department of Medicaid (ODM) awarded to the Ohio Health Care Association (OHCA) in 2016. The grant period ended at the close of 2018. The purpose of the grant, which was funded from civil monetary penalties accumulated in ODM's Resident Protection Fund, was to evaluate the impact of nurses achieving wound care certification on patient care in skilled nursing facilities (SNFs).

OHCA appreciates the support of ODM and the Centers for Medicare and Medicaid Services (CMS) in approving the wound care certification project and thereby supporting evaluation of the effectiveness of this intervention.

Proposal.

OHCA proposed to evaluate the wound care certification program provided by the Wound Care Educational Institute (WCEI) <http://www.wcei.net/>, the national leader in wound care programming.

OHCA explained that prevention and healing of pressure ulcers in SNF patients long has been a goal of providers, regulatory and payment agencies, and consumer advocates. Ohio's state average for the two CMS pressure ulcer Quality Measures (QMs) at the time of the proposal was in line with the national average (1.2% vs. 1.2% for short-stay patients; 5.6% vs. 5.9% for long-stay patients). The bottom 25% of Ohio centers on the QMs (about 200 buildings, which were the primary targets for the grant proposal) had long-stay rates ranging from 7.6% to 26.3% and short-stay rates ranging from 1.9% to 22.8%, well above the state and national averages.

The proposal pointed out that pressure ulcers are costly to treat. A survey of literature on the subject by the National Pressure Ulcer Advisory Panel (<https://www.npuap.org/wp-content/uploads/2012/01/Braden-NPUAP-cost-vs-prevention-final.pdf>) documented cost estimates ranging from \$43,000 to \$127,000.

OHCA posited that the planned intervention, improving knowledge and technical skills of nurses who implement pressure ulcer treatment and prevention efforts in SNFs, would have a positive impact on the centers' QMs, reflecting better patient outcomes and ultimately, cost savings.

The specific proposed intervention was to offer, through the Educational Foundation of OHCA and WCEI, comprehensive wound care educational programming, culminating in a certification examination. The programming was to be delivered through four separate sessions, with enrollment for each session limited to 50 students for maximum learning effectiveness.

OHCA proposed to offer enrollment first to nurses employed by SNFs in the bottom 25% of Ohio centers as measured by the pressure ulcer QMs. Any seats still available after thirty days would be offered to nurses from other Ohio SNFs on a first-come, first-served basis. As many of the bottom 25% SNFs declined to participate in the project, the majority of nurses who took the training were from other centers.

Applicant nurses were not limited to OHCA members. They were required to have at least two years' experience working in a SNF. The maximum enrollment was two nurses per center, although only one per center actually was enrolled because of high demand. The program was five days in length, with the fifth day being the certification examination.

For the program evaluation, OHCA originally proposed to analyze changes in both the long and short-stay pressure ulcer QMs at the centers with certified nurses. After examining pressure ulcer QM data over several quarters, OHCA decided to use only the long-stay, high-risk (LSHR) pressure ulcer QM for the analysis. OHCA observed considerable volatility in the short-stay QM. This phenomenon suggested that the short-stay QM moves for reasons other than care improvement, primarily its much smaller sample size, rendering it of little value for analyzing effectiveness of wound-care training.

The QMs were to be tracked beginning the second full quarter after certification and ending after eight quarters. OHCA proposed to provide quarterly data analysis reports to ODM.

OHCA originally proposed to apply the tracking and evaluation criteria in Table 1. Ultimately, the short-stay criterion was abandoned because that QM was not used in the project. SNFs were excluded from the evaluation if: a) the nurse did not complete the wound care certification course and pass the certification exam; or b) the certified nurse stopped working at the center.

Table 1

<i>Criterion</i>	<i>Bottom 25% Centers</i>	<i>Other Participating Centers</i>
Long stay pressure ulcers	15% improvement	5% improvement
Short stay pressure ulcers	0% on QM	0% on QM

Training and Certification.

The four wound care certification courses were completed during June, July, and August of 2016. Of the 200 seats available through the grant, 199 individuals attended. A total of 132 students passed the certification exam. The centers from which these 132 nurses came are referred to in this report as “participating SNFs.” OHCA divided the participating SNFs into two groups: Group A, consisting of 48 SNFs (36%) that were in the bottom 25% of facilities on the LSHR QM, and Group B, consisting of 84 SNFs (64%) that were not in the bottom 25%. The Group B participating SNFs were not stratified further in terms of their performance on the LSHR QM.

Data Analysis.

OHCA’s data analysis focused on whether the participating SNFs improved on the LSHR pressure ulcer QM after beginning to use a certified wound care specialist. OHCA also compared the QMs of the two groups with the overall averages for the state of Ohio and the nation.

OHCA began the analysis using the last full pre-training quarter (first quarter of 2016) as the baseline quarter and the fourth quarter of 2016 (the second quarter after the training was completed) as the first comparison quarter. There is up to a six-month lag in CMS’s publication of QM results, so the data for the first comparison quarter were not publicly available until OHCA’s second quarter 2017 report.

OHCA included SNFs in the analysis only if they continued to employ their certified wound care nurse. OHCA designed a data table listing each certified wound care nurse and the facility through which they were trained. OHCA staff called each of these centers each quarter to ensure the nurse’s continued employment before including the center in the quarterly report.

At the conclusion of the grant-funded project (fourth quarter 2018), the most recent, publicly available QM data were from the second quarter of that year. As of the fourth quarter, a total of 46 participating SNFs remained in the project. Fourteen of these centers were in Group A and 32 were in Group B. Over the two-plus years of the project, the attrition rate from movement of certified nurses was 65% of buildings with nurses who passed the certification exam. The overall attrition rate for the project, including centers whose nurses did not pass the certification exam, was 77%.

While clearly representing a small sample size, the 14 Group A participating SNFs that succeeded in retaining their wound care-certified nurse also succeeded in improving their LSHR pressure ulcer QMs. Among those SNFs, the median score on the QM declined 7 percentage points, from 9.55% to 2.44%, from the baseline quarter to the first quarter of 2018. For comparison purposes, the state and national averages on the LSHR pressure ulcer QM for the second quarter 2018 were 4.72% and 5.53%, respectively. The Group A buildings as a whole moved their pressure ulcer numbers below both of those averages.

Using the 15% improvement threshold for the LSHR pressure ulcer QM stated in the grant application, all but one of the 14 remaining Group A centers met the improvement threshold over the data analysis period.

Group B had a larger sample size but did not exhibit a conclusive impact for certified wound care nurses. The remaining 32 SNFs in Group B did see a decrease in their median score on the LSHR pressure ulcer QM, from 4.10% to 3.45%, during the project period. Only 10 of the Group B centers, however, met the group’s 5% improvement threshold. An additional 3 buildings maintained pressure ulcer-free status.

The attached Excel workbook contains supporting data for the final quarter of analysis. The first tab shows all Ohio skilled nursing facilities with their second quarter 2018 LSHR pressure ulcer data. The second tab lists the remaining facilities in Group A. The third tab contains the remaining facilities in Group B.

Final Financial Summary.

Total grant funding for this project was \$507,720, divided over four state fiscal years (2016-2019). Grant expenditures were primarily incurred in the first two fiscal years for the WCEI training, including course fees, training site costs, and lodging expense for participants who traveled 50 or more miles to attend. The grant also included a small amount to cover OHCA’s data analysis work.

The table below shows the grant figures and actual expenses in each of these categories. OHCA’s actual time on the data analysis and reporting was more than listed below on the table, but OHCA contributed the excess in kind to the project. OHCA returned the \$12,607.66 in unspent grant money to ODM.

	Grant	Actual Expenses	Variance
Course Fees	\$ 359,400.00	\$ 357,603.00	\$ 1,797.00
Onsite Logistics	\$ 53,240.00	\$ 35,332.00	\$ 17,908.00
Lodging (50+ miles)	\$ 88,960.00	\$ 96,057.34	\$ (7,097.34)
Data Analysis	\$ 6,120.00	\$ 6,120.00	0
TOTAL	\$ 507,720.00	\$ 495,086.19	\$ 12,607.66

Conclusion.

Although the sample size ended up being small after attrition, the results of the wound care certification grant project strongly suggest that having a certified nurse helps SNFs that are low performers on the LSHR QM reduce the number of pressure ulcers. Fewer pressure ulcers means not only better health outcomes for patients but also avoided treatment costs. Because of CMS privacy restrictions, OHCA did not have access to the raw numbers of long-stay patients who had pressure ulcers before, during, and after the project to be able to estimate human and fiscal savings. Nonetheless, fewer pressure ulcers is an undeniably positive outcome.

The results of the project also suggest that a certified wound care nurse may not make an appreciable difference for SNFs already performing well on the LSHR pressure ulcer QM. These centers already may have sufficient expertise to prevent pressure ulcers. Their disparate QM outcomes may reflect other, building-specific factors. While OHCA did not propose to stratify the Group B SNFs further by their baseline QMs, 5 of the 6 remaining Group B centers that had QMs worse than or equal to the statewide average at baseline improved during the project period. This result suggests that expanding the target group from the bottom 25% performers to the bottom 50% could yield positive results similar to those for Group A.

An aspect of this project that significantly detracts from the power of its results is the 77% attrition rate of participating SNFs, including both centers whose nurses did not pass the certification exam and centers that did not retain their certified nurses. While OHCA anticipated attrition at the outset, the project design did not account adequately for the very high level of attrition that occurred. Moreover, OHCA did not factor into the grant budget the cost of contacting every remaining center every quarter to ensure their nurse's continued employment.

Areas for further study include testing the results of this project on a larger group of targeted centers and developing better ways to account for certified nurse attrition. One approach to expanding the targeted sample would be to include centers in the bottom 50% on the LSHR pressure ulcer QM instead of the bottom 25%. Possible ways to address attrition could be including more SNFs at the outset, thereby increasing the number still in the project after attrition, and tracking certified nurses across centers with corresponding adjustment of the baseline period.
